

ARTICLE IV

WELDING DATA

QW-400 VARIABLES

QW-401 General

Each welding variable described in this Article is applicable as an essential, supplemental essential, or nonessential variable for procedure qualification when referenced in QW-250 for each specific welding process. Essential variables for performance qualification are referenced in QW-350 for each specific welding process. A change from one welding process to another welding process is an essential variable and requires requalification.

QW-401.1 Essential Variable (Procedure). A change in a welding condition which will affect the mechanical properties (other than notch toughness) of the weldment (for example, change in P-Number, welding process, filler metal, electrode, preheat or postweld heat treatment, etc.).

QW-401.2 Essential Variable (Performance). A change in a welding condition which will affect the ability of a welder to deposit sound weld metal (such as a change in welding process, deletion of backing, electrode, F-Number, technique, etc.).

QW-401.3 Supplemental Essential Variable (Procedure). A change in a welding condition which will affect the notch-toughness properties of a weldment (for example, change in welding process, uphill or down vertical welding, heat input, preheat or PWHT, etc.).

When a procedure has been previously qualified to satisfy all requirements other than notch toughness, it is then necessary only to prepare an additional test coupon using the same procedure with the same essential variables, but additionally with all of the required supplementary essential variables, with the coupon long enough to provide the necessary notch-toughness specimens.

When a procedure has been previously qualified to satisfy all requirements including notch toughness, but one or more supplementary essential variable is changed, then it is only necessary to prepare an additional test coupon using the same welding procedure and the new

supplementary essential variable(s), with the coupon long enough to provide the necessary notch-toughness specimens. If a previously qualified weld procedure has satisfactory notch-toughness values in the weld metal, then it is necessary only to test notch-toughness specimens from the heat affected zone when such are required.

QW-401.4 Nonessential Variable (Procedure). A change in a welding condition which will *not* affect the mechanical properties of a weldment (such as joint design, method of back gouging or cleaning, etc.)

QW-401.5 The welding data includes the welding variables grouped as joints, base metals, filler metals, position, preheat, postweld heat treatment, gas, electrical characteristics, and technique. For convenience, variables for each welding process are summarized in QW-416 for performance qualification.

QW-402 Joints

QW-402.1 A change in the type of groove (Vee-groove, U-groove, single-bevel, double-bevel, etc.).

QW-402.2 The addition or deletion of a backing.

QW-402.3 A change in the nominal composition of the backing.

QW-402.4 The deletion of the backing in single-welded groove welds. Double-welded groove welds are considered welding with backing.

QW-402.5 The addition of a backing or a change in its nominal composition.

QW-402.6 An increase in the fit-up gap, beyond that initially qualified.

QW-402.7 The addition of backing.

QW-402.8 A change in nominal size or shape of the stud at the section to be welded.

QW-402.9 In stud welding, a change in shielding as a result of ferrule or flux type.

QW-402.10 A change in the specified root spacing.

QW-402.11 The addition or deletion of nonmetallic retainers or nonfusing metal retainers.

QW-402.12 The welding procedure qualification test shall duplicate the joint configuration to be used in production within the limits listed, except that pipe or tube to pipe or tube may be used for qualification of a pipe or tube to other shapes, and solid round to solid round may be used for qualification of a solid round to other shapes:

(a) any change exceeding ± 10 deg in the angle measured for the plane of either face to be joined, to the axis of rotation;

(b) a change in cross-sectional area of the weld joint greater than 10%;

(c) a change in the outside diameter of the cylindrical weld interface of the assembly greater than ± 10 %;

(d) a change from solid to tubular cross section at the joint or vice versa regardless of QW-402.12(b).

QW-402.13 A change in the joint from spot to projection to seam or vice versa.

QW-402.14 A decrease in the center-to-center distance when the welds overlap. An increase or decrease of more than 10% in the spacing of the welds when they are within two diameters of each other.

QW-402.15 A change in the size or shape of the projection in projection welding.

QW-402.16 A decrease in the distance between the approximate weld interface and the final surface of the production corrosion-resistant or hard-facing weld metal overlay below the minimum thickness qualified as shown in QW-462.5(a) through QW-462.5(e). There is no limit on the maximum thickness for corrosion-resistant or hard-facing weld metal overlay that may be used in production.

QW-402.17 An increase in the thickness of the production spray fuse hard-facing deposit above the thickness deposited on the procedure qualification test coupon.

QW-402.18 When the joint is a lap joint, the following additional variables shall apply:

(a) a change of more than 10% in the distance to the edge of the material;

(b) a change of more than 10% in the joint overlap;

(c) a change in the number of layers of material;

(d) a change in the method of surface conditioning at the metal-to-metal interfaces.

QW-403 Base Metals

QW-403.1 A change from a base metal listed under one P-Number in QW/QB-422 to a metal listed under another P-Number or to any other base metal. When joints are made between two base metals that have different P-Numbers, a procedure qualification shall be made for the applicable combination of P-Numbers, even though qualification tests have been made for each of the two base metals welded to itself.

QW-403.2 The maximum thickness qualified is the thickness of the test coupon.

QW-403.3 Where the measurement of penetration can be made by visual or mechanical means, requalification is required where the base metal thickness differs by 20% from that of the test coupon thickness when the test coupon thickness is 1 in. (25 mm) and under, and 10% when the test coupon thickness is over 1 in. (25 mm) Where the measurement of penetration cannot be made, requalification is required where the base metal thickness differs by 10% from that of the test coupon when the test coupon thickness is 1 in. (25 mm) and under, and 5% when the test coupon thickness is over 1 in. (25 mm).

QW-403.4 Welding procedure qualifications shall be made using a base metal of the same type or grade or another base metal listed in the same group (see QW/QB-422) as the base metal to be used in production welding. When joints are to be made between base metals from two different groups, a procedure qualification must be made for the applicable combination of base metals, even though procedure qualification tests have been made for each of the two base metals welded to itself.

QW-403.5 Welding procedure qualifications shall be made using a base metal of the same type or grade or another base metal listed in the same P-Number and Group Number (see QW/QB-422) as the base metal to be used in production welding. A procedure qualification shall be made for each P-Number and Group Number combination of base metals, even though procedure qualification tests have been made for each of the two base metals welded to itself. If, however, the procedure specification for welding the combination of base metals specifies the same essential variables, including electrode or filler metal, as both specifications for welding each base metal to itself, such that base metals is the only change, then the procedure specification for welding the combination of base metals is also qualified. In addition, when base metals of two different P-Number Group Number combinations are qualified

using a single test coupon, that coupon qualifies the welding of those two P-Number Group Numbers to themselves as well as to each other using the variables qualified. This variable does not apply when impact testing of the heat-affected zone is not required by other Sections.

QW-403.6 The minimum base metal thickness qualified is the thickness of the test coupon T or $\frac{5}{8}$ in. (16 mm), whichever is less. However, where T is less than $\frac{1}{4}$ in. (6 mm), the minimum thickness qualified is $\frac{1}{2}T$. This limitation does not apply when a WPS is qualified with a PWHT above the upper transformation temperature or when an austenitic material is solution annealed after welding.

QW-403.7 For the multipass processes of shielded metal-arc, submerged-arc, gas tungsten-arc, and gas metal-arc, the maximum thickness qualified for $1\frac{1}{2}$ in. (38 mm) and over thickness T of the test coupon of QW-451.1 shall be 8 in. (203 mm) for the conditions shown in QW-451.1. For thicknesses greater than 8 in. (203 mm), the maximum thicknesses of base metal and deposited weld metal qualified is $1.33T$ or $1.33t$, as applicable.

QW-403.8 A change in base metal thickness beyond the range qualified in QW-451, except as otherwise permitted by QW-202.4(b).

QW-403.9 For single-pass or multipass welding in which any pass is greater than $\frac{1}{2}$ in. (13 mm) thick, an increase in base metal thickness beyond 1.1 times that of the qualification test coupon.

QW-403.10 For the short-circuiting transfer mode of the gas metal-arc process, when the qualification test coupon thickness is less than $\frac{1}{2}$ in. (13 mm), an increase in thickness beyond 1.1 times that of the qualification test coupon. For thicknesses of $\frac{1}{2}$ in. (13 mm) and greater, use QW-451.1 or QW-451.2, as applicable.

QW-403.11 Base metals specified in the WPS shall be qualified by a procedure qualification test which was made using base metals in accordance with QW-424.

QW-403.12 A change from a base metal listed under one P-Number of QW/QB-422 to a base metal listed under another P-Number. When joints are made between two base metals that have different P-Numbers, requalification is required even though the two base metals have been independently qualified using the same procedure. When the melt-in technique is used for joining P-No. 1, P-No. 3, P-No. 4, and P-No. 5A, a procedure qualification test with one P-Number metal shall also

qualify for that P-Number metal welded to each of the lower P-Number metals, but not vice versa.

QW-403.13 A change from one P-No. 5 to any other P-No. 5 (viz P-No. 5A to P-No. 5B or P-No. 5C or vice versa). A change from P-No. 9A to P-No. 9B but not vice versa. A change from one P-No. 10 to any other P-No. 10 (viz P-No. 10A to P-No. 10B or P-No. 10C, etc., or vice versa).

QW-403.15 Welding procedure qualifications for laser beam welding and electron beam welding shall be made using a base metal of the same type or grade or another base metal listed in the same P-Number (and the same group where given — see QW/QB-422) as the base metal to be used in production welding. When joints are to be made between base metals from two different P-Numbers (or two different groups), a procedure qualification must be made for the applicable combination of base metals even though procedure qualification tests have been made for each of the two base metals welded to itself.

QW-403.16 A change in the pipe diameter beyond the range qualified in QW-452, except as otherwise permitted in QW-303.1, QW-303.2, QW-381(c), or QW-382(c).

QW-403.17 In stud welding, a change in combination of base metal listed under one P-Number in QW/QB-422 and stud metal P-Number (as defined in Note below), or to any other base metal/stud metal combination.

NOTE: Stud metal shall be classified by nominal chemical composition and can be assigned a P-Number when it meets the nominal composition of any one of the P-Number metals.

QW-403.18 A change from one P-Number to any other P-Number or to a base metal not listed in QW/QB-422, except as permitted in QW-423, and in QW-420.2.

QW-403.19 A change to another base material type or grade (type or grade are materials of the same nominal chemical analysis and mechanical property range, even though of different product form), or to any other base material type or grade. When joints are made between two different types or grades of base material, a procedure qualification must be made for the applicable combinations of materials, even though procedure qualification tests have been made for each of the two base materials welded to itself.

QW-403.20 A change from a base metal, listed under one P-Number in QW/QB-422, to a metal listed under another P-Number or to any other base metal; from a

base metal of one subgroup to any other grouping in P-No. 10 or 11.

QW-403.21 The addition or deletion of a coating, plating or cladding, or a change in the nominal chemical analysis or thickness range of the plating or cladding, or a change in type of coating as specified in the WPS.

QW-403.22 A change in the nominal base metal thickness exceeding 5% of any outer sheet thickness or 10% of the nominal thickness of the total joint from that qualified.

QW-403.23 A change in base metal thickness beyond the range qualified in QW-453.

QW-404 Filler Metals

QW-404.1 A change in the cross-sectional area of the filler metal added (excluding buttering) or in the wire-feed speed greater than $\pm 10\%$ beyond that qualified.

QW-404.2 A decrease in the thickness or change in nominal specified chemical analysis of weld metal buttering beyond that qualified. (Buttering or surfacing is the deposition of weld metal on one or both faces of the joint prior to preparation of the joint for final electron beam welding.)

QW-404.3 A change in the size of the filler metal.

QW-404.4 A change from one F-Number in QW-432 to any other F-Number or to any other filler metal not listed in QW-432.

QW-404.5 (Applicable only to ferrous metals.) A change in the chemical composition of the weld deposit from one A-Number to any other A-Number in QW-442. Qualification with A-No. 1 shall qualify for A-No. 2 and vice versa.

The weld metal chemical composition may be determined by any of the following.

(a) For all welding processes — from the chemical analysis of the weld deposit taken from the procedure qualification test coupon.

(b) For SMAW, GTAW, and PAW — from the chemical analysis of the weld deposit prepared according to the filler metal specification, or from the chemical composition as reported either in the filler metal specification or the manufacturer's or supplier's certificate of compliance.

(c) For GMAW and EGW — from the chemical analysis of the weld deposit prepared according to the filler metal specification or the manufacturer's or supplier's certificate of compliance when the shielding

gas used was the same as that used to weld the procedure qualification test coupon.

(d) For SAW — from the chemical analysis of the weld deposit prepared according to the filler metal specification or the manufacturer's or supplier's certificate of compliance when the flux used was the same as that used to weld the procedure qualification test coupon.

In lieu of an A-Number designation, the nominal chemical composition of the weld deposit shall be indicated on the WPS and on the PQR. Designation of nominal chemical composition may also be by reference to the AWS classification (where such exists), the manufacturer's trade designation, or other established procurement documents.

QW-404.6 A change in the nominal size of the electrode or electrodes specified in the WPS.

QW-404.7 A change in the nominal diameter of the electrode to over $\frac{1}{4}$ in. (6 mm). This limitation does not apply when a WPS is qualified with a PWHT above the upper transformation temperature or when an austenitic material is solution annealed after welding.

QW-404.8 Addition or deletion, or a change in nominal amount or composition of supplementary deoxidation material (in addition to filler metal) beyond that qualified. (Such supplementary metal may be required for weld metal deoxidation for some metals being welded.)

QW-404.9

(a) A change in the indicator for minimum tensile strength (e.g., the 7 in F7A2-EM12K) when the flux wire combination is classified in Section II, Part C.

(b) A change in either the flux trade name or wire trade name when neither the flux nor the wire is classified in Section II, Part C.

(c) A change in the flux trade name when the wire is classified in Section II, Part C but the flux is not classified. A change in the wire classification within the requirements of QW-404.5 does not require requalification.

(d) A change in the flux trade name for A-No. 8 deposits.

QW-404.10 Where the alloy content of the weld metal is largely dependent upon the composition of the flux used, any change in any part of the welding procedure which would result in the important alloying elements in the weld metal being outside of the specification range of chemistry given in the Welding Procedure Specification. If there is evidence that the production welds are not being made in accordance with the

procedure specification, the authorized inspector may require that a check be made on the chemical composition of the weld metal. Such a check shall preferably be made on a production weld.

QW-404.12 A change in the SFA specification filler metal classification or to a filler metal not covered by an SFA specification, or from one filler metal not covered by an SFA specification to another which is not covered by an SFA specification.

When a filler metal conforms to an SFA specification classification, requalification is not required if a change is made in any of the following:

(a) from a filler metal which is designated as moisture-resistant to one which is not designated as moisture-resistant and vice-versa (i.e., from E7018R to E7018);

(b) from one diffusible hydrogen level to another (i.e., from E7018-H8 to E7018-H16);

(c) for carbon, low alloy, and stainless steel filler metals having the same minimum tensile strength and the same nominal chemical composition, a change from one low hydrogen coating type to another low hydrogen coating type (i.e., a change among EXX15, 16, or 18 or EXXX15, 16, or 17 classifications);

(d) from one position-usability designation to another for flux cored electrodes (i.e., a change from E70T-1 to E71T-1 or vice versa);

(e) from a classification which requires impact testing to the same classification which has a suffix which indicates that impact testing was performed at a lower temperature or exhibited greater toughness at the required temperature or both, as compared to the classification which was used during procedure qualification (i.e., a change from E7018 to E7018-1).

(f) from the classification qualified to another filler metal within the same SFA specification when the weld metal is exempt from Impact Testing by other Sections.

This exemption does not apply to hard-facing and corrosion-resistant overlays.

QW-404.14 The deletion or addition of filler metal.

QW-404.15 A change from one F-Number in QW-432 to any other F-Number or to any other filler metal, except as permitted in QW-433.

QW-404.17 A change in the type of flux or composition of the flux.

QW-404.18 A change from wire to plate electrodes, and vice versa.

QW-404.19 A change from consumable guide to nonconsumable guide, and vice versa.

QW-404.20 Any change in the method by which filler metal is added, such as preplaced shim, top strip, wire, wire feed, or prior weld metal buttering of one or both joint faces.

QW-404.21 For filler metal additions, any change from the nominal specified analysis of the filler metal qualified.

QW-404.22 The omission or addition of consumable inserts. Qualification in a single-welded butt joint, with or without consumable inserts, qualifies for fillet welds and single-welded butt joints with backing or double-welded butt joints. Consumable inserts that conform to SFA-5.30, except that the chemical analysis of the insert conforms to an analysis for any bare wire given in any SFA specification or AWS Classification, shall be considered as having the same F-Number as that bare wire as given in QW-432.

QW-404.23 A change from one of the following filler metal product forms to another:

(a) flux cored

(b) bare (solid) or metal cored

(c) powder

QW-404.24 The addition, deletion, or change of more than 10% in the volume of supplemental filler metal.

QW-404.27 Where the alloy content of the weld metal is largely dependent upon the composition of the supplemental filler metal (including powder filler metal for PAW), any change in any part of the welding procedure which would result in the important alloying elements in the weld metal being outside of the specification range of chemistry given in the Welding Procedure Specification.

QW-404.29 A change in the flux trade name and designation.

QW-404.30 A change in deposited weld metal thickness beyond the range qualified in QW-451 for procedure qualification or QW-452 for performance qualification, except as otherwise permitted in QW-303.1 and QW-303.2. When a welder is qualified using radiography, the thickness ranges of QW-452.1 apply.

QW-404.31 The maximum thickness qualified is the thickness of the test coupon.

QW-404.32 For the low voltage short-circuiting type of gas metal-arc process when the deposited weld metal thickness is less than $\frac{1}{2}$ in. (13 mm), an increase in deposited weld metal thickness beyond 1.1 times that of the qualification test deposited weld metal thickness.

For weld metal thicknesses of $\frac{1}{2}$ in. (13 mm) and greater, use QW-451.1 or QW-451.2, or QW-452.1 or QW-452.2, as applicable.

QW-404.33 A change in the SFA specification filler metal classification, or, if not conforming to an AWS filler metal classification, a change in the manufacturer's trade name for the electrode or filler metal. When optional supplemental designators, such as those which indicate moisture resistance (i.e., XXXXR), diffusible hydrogen (i.e., XXXX H16, H8, etc.), and supplemental impact testing (i.e., XXXX-1 or EXXXXM), are specified on the WPS, only filler metals which conform to the classification with the optional supplemental designator(s) specified on the WPS shall be used.

QW-404.34 A change in flux type (i.e., neutral to active or vice versa) for multilayer deposits in P-No. 1 materials.

QW-404.35 A change in the flux/wire classification or a change in either the electrode or flux trade name when not classified in an SFA specification. Requalification is not required when a wire/flux combination conforms to an SFA specification and a change is made from one diffusible hydrogen level to another (i.e., a change from F7A2-EA1-A1H4 to F7A2-EA1-A1H16). This variable does not apply when the weld metal is exempt from impact testing by other Sections. This exemption does not apply to hard facing and corrosion-resistant overlays.

QW-404.36 When flux from recrushed slag is used, each batch or blend, as defined in SFA-5.01, shall be tested in accordance with Section II, Part C by either the manufacturer or user, or qualified as an unclassified flux in accordance with QW-404.9.

QW-404.37 A change in the composition of the deposited weld metal from one A-Number in QW-442 to any other A-Number, or to an analysis not listed in the table. Each AWS classification of A-No. 8 or A-No. 9 analysis of QW-442, or each nonferrous alloy in QW-432, shall require separate WPS qualification. A-Numbers may be determined in accordance with QW-404.5.

QW-404.38 A change in the nominal electrode diameter used for the first layer of deposit.

QW-404.39 For submerged-arc welding and electro-slag welding, a change in the nominal composition or type of flux used. Requalification is not required for a change in flux particle size.

QW-404.41 A change of more than 10% in the powdered metal feed rate recorded on the PQR.

QW-404.42 A change of more than 5% in the particle size range of the powder.

QW-404.43 A change in the powdered metal particle size range recorded on the PQR.

QW-404.44 A change from a homogeneous powdered metal to a mechanical mixed powdered metal or vice versa.

QW-404.45 A change in the form of filler metal from solid to fabricated wire, flux-cored wire, powdered metal, or vice versa.

QW-404.46 A change in the powder feed rate range qualified.

QW-404.47 A change of more than 10% in the filler metal size and/or powder metal particle size.

QW-404.48 A change of more than 10% in the powder metal density.

QW-404.49 A change of more than 10% in the filler metal or powder metal feed rate.

QW-404.50 The addition or deletion of flux to the face of a weld joint for the purpose of affecting weld penetration.

QW-405 Positions

QW-405.1 The addition of other welding positions than those already qualified. See QW-120, QW-130, and QW-303.

QW-405.2 A change from any position to the vertical position uphill progression. Vertical-uphill progression (e.g., 3G, 5G, or 6G position) qualifies for all positions. In uphill progression, a change from stringer bead to weave bead. This limitation does not apply when a WPS is qualified with a PWHT above the upper transformation temperature or when an austenitic material is solution annealed after welding.

QW-405.3 A change from upward to downward, or from downward to upward, in the progression specified for any pass of a vertical weld, except that the cover or wash pass may be up or down. The root pass may also be run either up or down when the root pass is removed to sound weld metal in the preparation for welding the second side.

QW-405.4 Except as specified below, the addition of other welding positions than already qualified.

(a) Qualification in the horizontal, vertical, or overhead position shall also qualify for the flat position. Qualification in the horizontal fixed position, 5G, shall

qualify for the flat, vertical, and overhead positions. Qualification in the horizontal, vertical, and overhead positions shall qualify for all positions. Qualification in the inclined fixed position, 6G, shall qualify for all positions.

(b) A fabricator who does production welding in a particular orientation may make the tests for procedure qualification in this particular orientation. Such qualifications are valid only for the positions actually tested, except that an angular deviation of ± 15 deg is permitted in the inclination of the weld axis and the rotation of the weld face as defined in QW-461.1. A test specimen shall be taken from the test coupon in each special orientation.

(c) For hard-facing weld metal overlay, qualification in the 3G, 5G, or 6G positions, where 5G or 6G pipe coupons include at least one vertical segment completed utilizing the up-hill progression or a 3G plate coupon is completed utilizing the up-hill progression, shall qualify for all positions. Chemical analysis, hardness, and macro-etch tests required in QW-453 may be limited to a single, vertical up-hill overlaid segment as shown in QW-462.5(b).

(d) For hard-facing weld metal overlay, a change from vertical down to vertical up-hill progression shall require requalification.

QW-406 Preheat

QW-406.1 A decrease of more than 100°F (56°C) in the preheat temperature qualified. The minimum temperature for welding shall be specified in the WPS.

QW-406.2 A change in the maintenance or reduction of preheat upon completion of welding prior to any required postweld heat treatment.

QW-406.3 An increase of more than 100°F (56°C) in the maximum interpass temperature recorded on the PQR. This limitation does not apply when a WPS is qualified with a PWHT above the upper transformation temperature or when an austenitic material is solution annealed after welding.

QW-406.4 A decrease of more than 100°F (56°C) in the preheat temperature qualified or an increase in the maximum interpass temperature recorded on the PQR. The minimum temperature for welding shall be specified in the WPS.

QW-406.5 A change in the maintenance or reduction of preheat upon completion of spraying and prior to fusing.

QW-406.6 A change of more than 10% in the amplitude or number of preheating cycles from that qualified.

QW-407 Postweld Heat Treatment

QW-407.1 A separate procedure qualification is required for each of the following conditions.

(a) For P-No. 1, P-No. 3, P-No. 4, P-No. 5, P-No. 6, P-No. 9, P-No. 10, and P-No. 11 materials, the following postweld heat treatment conditions apply:

(1) No PWHT;

(2) PWHT below the lower transformation temperature;

(3) PWHT above the upper transformation temperature (e.g., normalizing);

(4) PWHT above the upper transformation temperature followed by heat treatment below the lower transformation temperature (e.g., normalizing or quenching followed by tempering);

(5) PWHT between the upper and lower transformation temperatures.

(b) For all other materials, the following postweld heat treatment conditions apply:

(1) No PWHT;

(2) PWHT within a specified temperature range.

QW-407.2 A change in the postweld heat treatment (see QW-407.1) temperature and time range.

The procedure qualification test shall be subjected to PWHT essentially equivalent to that encountered in the fabrication of production welds, including at least 80% of the aggregate times at temperature(s). The PWHT total time(s) at temperature(s) may be applied in one heating cycle.

QW-407.4 For a procedure qualification test coupon receiving a postweld heat treatment in which the upper transformation temperature is exceeded, the maximum qualified thickness for production welds is 1.1 times the thickness of the test coupon.

QW-407.5 A separate procedure qualification is required for each of the following conditions:

(a) No PWHT;

(b) A change of more than 10% in the number of post heating cycles following the welding interval;

(c) PWHT within a specified temperature and time range if heat treatment is performed separately from the welding operation.

QW-407.6 A change in postweld heat treatment condition in QW-407.1 or an increase of 25% or more in total time at postweld heat treating temperature.

QW-407.7 A change in the heat treatment temperature range qualified if heat treatment is applied after fusing.

QW-408 Gas

QW-408.1 The addition or deletion of trailing shielding gas and/or a change in its composition.

01 QW-408.2 A separate procedure qualification is required for each of the following conditions:

- (a) a change from a single shielding gas to any other single shielding gas;
- (b) a change from a single shielding gas to a mixture of shielding gasses, and vice versa;
- (c) a change in the specified percentage composition of a shielding gas mixture;
- (d) the addition or omission of shielding gas.

The AWS classification of SFA 5.32 may be used to specify the shielding gas composition.

QW-408.3 A change in the specified flow rate range of the shielding gas or mixture of gases.

A02 QW-408.4 A change in the composition of the orifice or shielding gas.

QW-408.5 The addition or deletion of gas backing, a change in backing gas composition, or a change in the specified flow rate range of the backing gas.

QW-408.6 Any change of environment shielding such as from vacuum to an inert gas, or vice versa.

QW-408.7 A change in the type of fuel gas.

QW-408.8 The omission of inert gas backing except that requalification is not required when welding a single-welded butt joint with a backing strip or a double-welded butt joint or a fillet weld. This exception does not apply to P-No. 51 through P-No. 53, P-No. 61 through P-No. 62, and P-No. 10I metals.

01 QW-408.9 For groove welds in P-No. 41 through P-No. 47 and all welds of P-No. 10I, P-No. 10J, P-No. 10K, P-No. 51 through P-No. 53, and P-No. 61 through P-No. 62 metals, the deletion of backing gas or a change in the nominal composition of the backing gas from an inert gas to a mixture including non-inert gas(es).

01 QW-408.10 For P-No. 10I, P-No. 10J, P-No. 10K, P-No. 51 through P-No. 53, and P-No. 61 through P-No. 62 metals, the deletion of trailing shielding gas, or a change in the nominal composition of the trailing gas from an inert gas to a mixture including non-inert gas(es), or a decrease of 10% or more in the trailing gas flow rate.

QW-408.11 The addition or deletion of one or more of the following: shielding gas, trailing shielding gas, backing gas, or plasma-removing gas.

QW-408.12 A change of more than 5% in the flow rate of one or more of the following: shielding gas, trailer shielding gas, backing gas, and plasma-removing gas.

QW-408.13 A change in the position or orientation of plasma-removing gas jet relative to the workpiece (e.g., coaxial transverse to beam).

QW-408.14 A change in the oxygen or fuel gas pressure beyond the range qualified.

QW-408.15 In gas metal-arc welding and gas tungsten-arc welding: a change from a single gas to any other single gas or to a mixture of gases, or vice versa; a change in specified percentage composition of gas mixture or omission of shielding gas; a decrease of 10% or more in the rate of flow of shielding gas or mixture.

QW-408.16 A change of more than 5% in the flow rate of the plasma-arc gas or powdered metal feed gas recorded on the PQR.

QW-408.17 A change in the plasma-arc gas, shielding gas, or powdered metal feed gas from a single gas to any other single gas, or to a mixture of gases, or vice versa.

QW-408.18 A change of more than 10% in the gas mixture composition of the plasma-arc gas, shielding gas, or powdered metal feed gas recorded on the PQR.

QW-408.19 A change in the nominal composition of the powder feed gas or (plasma-arc spray) plasma gas qualified.

QW-408.20 A change of more than 5% in the plasma gas flow rate range qualified.

QW-408.21 A change in the flow rate of the orifice or shielding gas.

A02

QW-409 Electrical Characteristics

QW-409.1 An increase in heat input, or an increase in volume of weld metal deposited per unit length of weld, over that qualified. The increase may be measured by either of the following:

- (a) Heat input [J/in. (J/mm)]

$$= \frac{\text{Voltage} \times \text{Amperage} \times 60}{\text{Travel Speed [in./min (mm/min)]}}$$

(b) Volume of Weld Metal = an increase in bead size or a decrease in length of weld bead per unit length of electrode.

The requirement for measuring the heat input or volume of deposited weld metal does not apply when the WPS is qualified with a PWHT above the upper transformation temperature or a solution anneal after welding austenitic materials.

QW-409.2 A change from spray arc, globular arc, or pulsating arc to short circuiting arc, or vice versa.

QW-409.3 The addition or deletion of pulsing current to dc power source.

QW-409.4 A change from ac to dc, or vice versa; and in dc welding, a change from electrode negative (straight polarity) to electrode positive (reverse polarity), or vice versa.

QW-409.5 A change of $\pm 15\%$ from the amperage or voltage ranges in the qualified WPS.

QW-409.6 A change in the beam current of more than $\pm 5\%$, voltage of more than $\pm 2\%$, welding speed of more than $\pm 2\%$, beam focus current of more than $\pm 5\%$, gun-to-work distance of more than $\pm 5\%$, or a change in oscillation length or width of more than $\pm 20\%$ from those previously qualified.

QW-409.7 Any change in the beam pulsing frequency duration from that qualified.

QW-409.8 A change in the range of amperage, or except for SMAW and GTAW welding, a change in the range of voltage. A change in the range of electrode wire feed speed may be used as an alternative to amperage.

QW-409.9 A change in the arc timing of more than $\pm \frac{1}{10}$ sec.

QW-409.10 A change in amperage of more than $\pm 10\%$.

QW-409.11 A change in the power source from one model to another.

QW-409.12 A change in type or size of tungsten electrode.

QW-409.13 A change in the shape or dimensions of the welding electrode; a change from one RWMA (Resistance Welding Manufacturer's Association) class electrode material to another.

QW-409.14 Addition or deletion of upslope or downslope current control, or a change of more than 10% in the slope current time or amplitude.

QW-409.15 A change of more than 5% in the electrode pressure, the welding current, or the welding time cycle from that qualified, except that requalification is not required if there is a change of not more than 10% in either the electrode pressure or the welding current or the welding time cycle, provided the remaining two variables remain at the values qualified. A change from ac to dc or vice versa. The addition or deletion of pulsing current to a dc power source. When using pulsing dc current, a change of more than 5% in the pulse amplitude, width, or number of pulses per cycle from that qualified.

QW-409.16 A change from synchronous to asynchronous timing.

QW-409.17 A change in the power supply primary voltage or frequency, or in the transformer turns ratio, tap setting, choke position, secondary open circuit voltage or phase control setting.

QW-409.18 A change in the procedure or frequency of tip cleaning.

QW-409.19 Any change in the beam pulsing frequency and pulse duration from that qualified.

QW-409.20 Any change in the following variables: mode of operation (from pulsed to continuous and vice versa), energy distribution across the beam (i.e., multimode or gaussian).

QW-409.21 Any change in the following variables: a change of more than 5% in the power delivered to the work surface as measured by calorimeter or other equivalent methods; a change of more than 2% in the travel speed; a change of more than 2% of the ratio of the beam diameter to focal length; a change of more than 2% of the lens to work distance.

QW-409.22 An increase of more than 10% in the amperage used in application for the first layer.

QW-409.23 A change of more than 10% in the ranges of amperage or voltage qualified.

QW-409.24 A change of more than 10% in the filler wire wattage recorded on the PQR. Wattage is a function of current voltage, and stickout dimension.

QW-409.25 A change of more than 10% in the plasma-arc current or voltage recorded on the PQR.

QW-409.26 For the first layer only, an increase in heat input of more than 10% or an increase in volume

of weld metal deposited per unit length of weld of more than 10% over that qualified. The increase may be measured by either of the following:

(a) Heat input [J/in. (J/mm)]

$$= \frac{\text{Voltage} \times \text{Amperage} \times 60}{\text{Travel Speed} [\text{in./min (mm/min)}]}$$

(b) Volume of Weld Metal = an increase in bead size or a decrease in length of weld bead per unit length of electrode.

QW-410 Technique

QW-410.1 A change from the stringer bead technique to the weave bead technique, or vice versa.

QW-410.2 A change in the nature of the flame, oxidizing to reducing, or vice versa.

QW-410.3 A change in the orifice, cup, or nozzle size.

QW-410.4 A change in the welding technique, forehand to backhand, or vice versa.

QW-410.5 A change in the method of initial and interpass cleaning (brushing, grinding, etc.)

QW-410.6 A change in the method of back gouging.

QW-410.7 A change in width, frequency, or dwell time of oscillation, for machine or automatic welding only.

QW-410.8 A change in the contact tube to work distance.

QW-410.9 A change from multipass per side to single pass per side. This limitation does not apply when a WPS is qualified with a PWHT above the upper transformation temperature or when an austenitic material is solution annealed after welding.

QW-410.10 A change from single electrode to multiple electrode, or vice versa, for machine or automatic welding only. This limitation does not apply when a WPS is qualified with a PWHT above the upper transformation temperature or when an austenitic material is solution annealed after welding.

QW-410.11 A change from closed chamber to out-of-chamber conventional torch welding in P-No. 51 through P-No. 53 metals, but not vice versa.

QW-410.12 A change from the melt-in technique to the keyhole technique of welding, or vice versa, or the inclusion of both techniques though each has been individually qualified.

QW-410.14 A change in the angle of the axis of the beam relative to the workpiece.

QW-410.15 A change in the spacing of multiple electrodes for machine or automatic welding.

QW-410.17 A change in the type of the welding equipment.

QW-410.18 An increase in the absolute pressure of the vacuum welding environment beyond that qualified.

QW-410.19 Any change in filament type, size, or shape.

QW-410.20 The addition of a wash pass.

QW-410.21 A change of welding from one side to welding from both sides, or vice versa.

QW-410.22 A change in either of the following stud welding parameters: a change of stud gun model; a change in the lift more than $\pm \frac{1}{32}$ in. (0.8 mm).

QW-410.25 A change from manual or semiautomatic to machine or automatic welding and vice versa.

QW-410.26 The addition or deletion of peening.

QW-410.27 A change in the rotational speed producing a change in the outside surface velocity [ft/min (m/min)] greater than $\pm 10\%$ of the outside surface velocity qualified.

QW-410.28 A change in the thrust load (lb) greater than $\pm 10\%$ of the thrust load qualified.

QW-410.29 A change in the rotational energy (lb-ft²) greater than $\pm 10\%$ of the rotational energy qualified.

QW-410.30 Any change in upset dimension (overall loss in length of parts being joined) greater than $\pm 10\%$ of the upset qualified.

QW-410.31 A change in the method of preparing the base metal prior to welding (e.g., changing from mechanical cleaning to chemical cleaning or to abrasive cleaning, or vice versa).

QW-410.32 A change of more than 10% in the holding pressure prior to or after welding. A change of more than 10% in the electrode holding time.

QW-410.33 A change from one welding type to another, or modification of equipment, including Manufacturer, control panel, model number, electrical rating or capacity, type of electrical energy source, or method of applying pressure.

QW-410.34 Addition or deletion of an electrode cooling medium and where it is used.

QW-410.35 A change in the distance between arms or a change in the throat depth.

QW-410.37 A change from single to multiple pass or vice versa.

QW-410.38 A change from multiple-layer to single layer cladding/hardsurfacing, or vice versa.

QW-410.39 A change in the torch type or tip size.

QW-410.40 For submerged-arc welding and electro-slag welding, the deletion of a supplementary device for controlling the magnetic field acting on the weld puddle.

QW-410.41 A change of more than 15% in the travel speed range recorded on the PQR.

QW-410.42 The addition or elimination of oscillation of the plasma torch or filler wires; a change from simple harmonic to constant velocity oscillating motion or vice versa; a change of more than 10% in oscillation displacement recorded on the PQR; however, a procedure qualified using a minimum oscillation displacement and a procedure qualified using a maximum oscillation displacement shall qualify for all weld bead oscillations in between, with all other essential variables remaining the same.

QW-410.43 For the torch or workpiece, a change of more than 10% in the travel speed range qualified.

QW-410.44 A change of more than 15% in the spray-torch to workpiece distance qualified.

QW-410.45 A change in the method of surface preparation of the base metal to be hard-faced (example: sandblasting versus chemical cleaning).

QW-410.46 A change in the spray-torch model or tip orifice size.

QW-410.47 A change of more than 10% in the fusing temperature range qualified. A change in the rate of cooling from the fusing temperature of more than 50°F/hr (28°C/hr), a change in the fusing method (example: torch, furnace, induction).

QW-410.48 A change in the constricted arc from transferable to nontransferable or vice versa.

QW-410.49 A change in the diameter of the plasma torch-arc constricting orifice.

QW-410.50 A change in the number of electrodes acting on the same welding puddle.

QW-410.51 The addition or elimination of oscillation of the electrode or electrodes.

QW-410.52 A change in the method of delivering the filler metal to the molten pool, such as from the leading or trailing edge of the torch, the sides of the torch, or through the torch.

QW-410.53 A change of more than 20% in the center-to-center weld bead distance.

Welding Processes:

OFW	Oxyfuel gas welding
SMAW	Shielded metal-arc welding
SAW	Submerged-arc welding
GMAW	Gas metal-arc welding
GTAW	Gas tungsten-arc welding
PAW	Plasma-arc welding

Legend:

ϕ	Change	t	Thickness
+	Addition	\uparrow	Uphill
-	Deletion	\downarrow	Downhill

NOTES:

(1) For description, see Section IV.

(2) Flux-cored arc welding as shown in QW-355, with or without additional shielding from an externally supplied gas or gas mixture, is included.

QW-420 Material Groupings

QW-420.1 P-Numbers. To reduce the number of welding and brazing procedure qualifications required, base metals have been assigned P-Numbers, and for ferrous base metals which have specified impact test requirements, Group Numbers within P-Numbers. These assignments are based essentially on comparable base metal characteristics, such as composition, weldability, brazeability, and mechanical properties, where this can logically be done. These assignments do not imply that base metals may be indiscriminately substituted for a base metal which was used in the qualification test without consideration of compatibility from the standpoint of metallurgical properties, postweld heat treatment, design, mechanical properties, and service requirements. Where notch toughness is a consideration, it is presupposed that the base metals meet the specific requirements.

Base Metal	Welding	Brazing
Steel and steel alloys	P-No. 1 through P-No. 11 incl. P-No. 5A, 5B, and 5C	P-No. 101 through P-No. 103
Aluminum and aluminum-base alloys	P-No. 21 through P-No. 25	P-No. 104 and P-No. 105
Copper and copper-base alloys	P-No. 31 through P-No. 35	P-No. 107 and P-No. 108
Nickel and nickel-base alloys	P-No. 41 through P-No. 47	P-No. 110 through P-No. 112
Titanium and titanium-base alloys	P-No. 51 through P-No. 53	P-No. 115
Zirconium and zirconium-base alloys	P-No. 61 through P-No. 62	P-No. 117

When a base metal with a UNS number designation is assigned a P-Number or P-Number plus Group Number, then a base metal listed in a different ASME material specification with the same UNS number shall be considered that P-Number or P-Number plus Group Number. For example, SB-163, UNS N08800 is P-Number 45; therefore, all ASME specifications listing a base metal with the UNS N08800 designation shall be considered P-Number 45 (i.e., SB-407, SB-408, SB-514, etc.) whether or not these specifications are listed in QW/QB-422. Since a minimum tensile value is required for procedure qualification, only base metals listed in QW/QB-422 may be used for test coupons as defined in QW-424.

In those instances where materials in the 1971 Edition of this Section have been given different P-Numbers or assigned to Subgroups within a P-Number in the 1974 Edition of this Section, those procedure and

performance qualifications will continue to be valid based on the new P-Number designation.

In the column heading "Minimum Specified Tensile, ksi" of QW/QB-422, the values given are those of the base metal specification, except as otherwise identified in QW-153 or QB-153. These are also the acceptance values for the room temperature tensile tests of the welding or brazing procedure qualification, except as otherwise allowed in QW-153 or QB-153.

QW-420.2 S-Numbers (Non-Mandatory). S-Numbers are a listing of materials which are acceptable for use by the ASME B31 Code for Pressure Piping, or by selected Boiler and Pressure Vessel Code Cases, but which are not included within ASME Boiler and Pressure Vessel Code Material Specifications (Section II). These materials are grouped in S-Number or S-Number plus Group Number groupings similar to the P-Number groupings. There is no mandatory requirement that S-Numbers be used.

Brazing or Welding Procedure Qualification with a base metal in one P-Number (or P-Number plus Group Number) or one S-Number (or S-Number plus Group Number), qualifies for all other base metals in the same S-Number grouping. Also, qualification with a base metal in one S-Number, or S-Number plus Group Number, qualifies for all other base metals in the same S-Number grouping. Qualifications for S-Number materials do not qualify corresponding P-Number materials. Base metals not assigned an S-Number or a P-Number shall require individual procedure qualification.

Material produced under an ASTM specification shall be considered to have the same S-Number or S-Number plus Group Number as that of the P-Number or P-Number plus Group Number assigned to the same grade or type material in the corresponding ASME specification (i.e., SA-240 Type 304 is assigned P-Number 8, Group Number 1; therefore, A 240 Type 304 is considered S-Number 8, Group Number 1). Additionally, when a base metal with a UNS number designation is assigned an S-Number or S-Number plus Group Number, then a base metal listed in a different material specification with the same UNS number shall be considered that S-Number or S-Number plus Group Number. Since a minimum tensile value is required for procedure qualification, only base metals listed in QW/QB-422 may be used for test coupons.

For Performance Qualification of brazers, welders, brazing operators, and welding operators, the requirements for P-Numbers of base metals shall also be applied to the same S-Numbers of base metals. Qualification with P-Numbers in accordance with QB-310.3 and QW-403.18 qualifies for corresponding S-Numbers and vice versa.

QW-423 Alternate Base Materials for Welder Qualification

QW-423.1 Base material used for welder qualification may be substituted for the P-Number material specified in the WPS in accordance with the following.

Base Metal(s) for Welder Qualification	Qualified Production Base Metal(s)
P-No. 1 through P-No. 11, P-No. 34, or P-No. 41 through P-No. 47	P-No. 1 through P-No. 11, P-No. 34, P-No. 41 through P-No. 47 and unassigned metals of similar chemical composition to these metals
P-No. 21 through P-No. 25	P-No. 21 through P-No. 25
P-No. 51 through P-No. 53 or P-No. 61 through P-No. 62	P-No. 51 through P-No. 53 and P-No. 61 through P-No. 62

QW-423.2 Metals used for welder qualification conforming to national or international standards or specifications may be considered as having the same P- or S-Number as an assigned metal provided it meets the mechanical and chemical requirements of the assigned metal. The base metal specification and corresponding P- or S-Number shall be recorded on the qualification record.

QW-424 Base Metals Used for Procedure Qualification

QW-424.1 Base metals are assigned P-Numbers in QW/QB-422; metals which do not appear in QW/QB-422 are considered to be unassigned metals except as otherwise defined in QW-420.1 for base metals having

the same UNS numbers. Unassigned metals shall be identified in the WPS and on the PQR by specification, type and grade, or by chemical analysis and mechanical properties. The minimum tensile strength shall be defined by the organization which specified the unassigned metal if the tensile strength of that metal is not defined by the material specification.

Base Metal(s) Used for Procedure Qualification Coupon	Base Metals Qualified
One metal from a P-Number to any metal from the same P-Number	Any metals assigned that P-Number
One metal from a P-Number to any metal from any other P-Number	Any metal assigned the first P-Number to any metal assigned the second P-Number
One metal from P-No. 3 to any metal from P-No. 3	Any P-No.3 metal to any metal from P-No. 3 or P-No. 1
One metal from P-No. 4 to any metal from P-No. 4	Any P-No. 4 metal to any metal from P-Nos. 4, 3, or 1
One metal from P-No. 5A to any metal from P-No. 5A	Any P-No. 5A metal to any metal from P-Nos. 5A, 4, 3, or 1 metals
One metal from P-No. 5A to a metal from P-No. 4, or P-No. 3, or P-No. 1	Any P-No. 5A metal to any metal assigned to P-No. 4, or P-No. 3, or P-No. 1
One metal from P-No. 4 to a metal from P-No. 3 or P-No. 1	Any P-No. 4 metal to any metal assigned to P-No. 3 or P-No. 1
Any unassigned metal to the same unassigned metal	The unassigned metal to itself
Any unassigned metal to any P-Number metal	The unassigned metal to any metal assigned to the same P-Number as the qualified metal
Any unassigned metal to any other unassigned metal	The first unassigned metal to the second unassigned metal

QW-430 F-NUMBERS**QW-431 General**

The following F-Number grouping of electrodes and welding rods in QW-432 is based essentially on their usability characteristics, which fundamentally determine the ability of welders to make satisfactory welds with a given filler metal. This grouping is made to reduce the number of welding procedure and performance qualifications, where this can logically be done. The grouping does not imply that base metals or filler metals within a group may be indiscriminately substituted for

a metal which was used in the qualification test without consideration of the compatibility of the base and filler metals from the standpoint of metallurgical properties, postweld heat treatment design and service requirements, and mechanical properties.

**QW-433 Alternate F-Numbers for Welder
Performance Qualification**

The following tables identify the filler metal or electrode that the welder used during qualification testing as "Qualified With," and the electrodes or filler metals that the welder is qualified to use in production welding as "Qualified For." See QW-432 for the F-Number assignments.

Qualified With →	F-No. 1 With Backing	F-No. 1 Without Backing	F-No. 2 With Backing	F-No. 2 Without Backing	F-No. 3 With Backing	F-No. 3 Without Backing	F-No. 4 With Backing	F-No. 4 Without Backing	F-No. 5 With Backing	F-No. 5 Without Backing
Qualified For ↓										
F-No. 1 With Backing	X	X	X	X	X	X	X	X	X	X
F-No. 1 Without Backing		X								
F-No. 2 With Backing			X	X	X	X	X	X		
F-No. 2 Without Backing				X						
F-No. 3 With Backing					X	X	X	X		
F-No. 3 Without Backing						X				
F-No. 4 With Backing							X	X		
F-No. 4 Without Backing								X		
F-No. 5 With Backing									X	X
F-No. 5 Without Backing										X

Qualified With	Qualified For
Any F-No. 6	All F-No. 6 [Note (1)]
Any F-No. 21 through F-No. 25	All F-No. 21 through F-No. 25
Any F-No. 31, F-No. 32, F-No. 33, F-No. 35, F-No. 36, or F-No. 37	Only the same F-Number as was used during the qualification test
F-No. 34 or any F-No. 41 through F-No. 45	F-No. 34 and all F-No. 41 through F-No. 45
Any F-No. 51 through F-No. 54	All F-No. 51 through F-No. 54
Any F-No. 61	All F-No. 61
Any F-No. 71 through F-No. 72	Only the same F-Number as was used during the qualification test

NOTE:

- (1) Deposited weld metal made using a bare rod not covered by an SFA Specification but which conforms to an analysis listed in QW-442 shall be considered to be classified as F-No. 6.

**QW-440 WELD METAL CHEMICAL
COMPOSITION**

QW-441 General

Identification of weld metal chemical composition designated on the PQR and WPS shall be as given in QW-404.5.

**QW-442
A-NUMBERS**
Classification of Ferrous Weld Metal Analysis for Procedure Qualification

A-No.	Types of Weld Deposit	Analysis, % [Note (1)]					
		C	Cr	Mo	Ni	Mn	Si

$1\frac{1}{2}$ (38) and over	$\frac{3}{16}$ (4.8)	8 (203) [Note (5)]			2 [Note (4)] 4 2 [Note (4)] 4

NOTES:

- (1) See QW-403 (.2, .3, .6, .9, .10), QW-404-32, and QW-407.4 for further limits on range of thickness qualified. Also, see QW-202 (.2, .3, .4) for allowable exceptions.
- (2) For combination of welding procedures, see QW-200.4.
- (3) Four side-bend tests may be substituted for the required face- and root-bend tests, when thickness T is $\frac{3}{8}$ in. (10 mm) and over.
- (4) See QW-151 (.1, .2, .3) for details on multiple specimens when coupon thicknesses are over 1 in. (25 mm).
- (5) For the welding processes of QW-403.7 only, otherwise per Note (1) or $2T$, or $2t$, whichever is applicable.

QW-451.2
GROOVE-TENSION TESTS AND LONGITUDINAL-BEND TESTS

Thickness T of Test Coupon Welded, in. (mm)	Range of Thickness T of Base Metal Qualified, in. (mm) [Notes (1) and (2)]	Thickness t of Deposited Weld Metal Qualified, in. (mm) [Notes (1) and (2)]	Type and Number of Tests Required (Tension and Guided-Bend Tests) [Note (2)]				
			Min.	Max.	Tension, QW-150	Face Bend, QW-160	Root Bend, QW-160
Less than $\frac{1}{16}$ (1.6)	T	$2T$	$2t$	$2t$	2	2	2
$\frac{1}{16}$ to $\frac{3}{8}$ (1.6 to 10), incl.	$\frac{1}{16}$ (1.6)	$2T$	$2t$	$2t$	2	2	2
Over $\frac{3}{8}$ (10)	$\frac{3}{16}$ (4.8)	$2T$	$2t$	$2t$	2	2	2

NOTES:

- (1) See QW-403 (.2, .3, .6, .7, .9, .10), QW-404.32, and QW-407.4 for further limits on range of thickness qualified. These are also applicable to deposited weld metal thicknesses. Also, see QW-202 (.2, .3, .4) for allowable exceptions.
- (2) For combination of welding procedures, see QW-200.4.

**QW-451.3
FILLET-WELD TESTS**

Type of Joint	Thickness of Test Coupons as Welded, in.	Range Qualified	Type and Number of Tests Required [QW-462.4(a) or QW-462.4(d)]
			Macro
Fillet	Per QW-462.4(a)	All fillet sizes on all base metal thicknesses and all diameters	5
Fillet	Per QW-462.4(d)		4

GENERAL NOTE: A production assembly mockup may be substituted in accordance with QW-181.1.1. When a production assembly mockup is used, the range qualified shall be limited to the fillet weld size, base metal thickness, and configuration of the mockup. Alternatively, multiple production assembly mockups may be qualified. The range of thickness of the base metal qualified shall be no less than the thickness of the thinner member tested and no greater than the thickness of the thicker member tested. The range for fillet weld sizes qualified shall be limited to no less than the smallest fillet weld tested and no greater than the largest fillet weld tested. The configuration of production assemblies shall be the same as that used in the production assembly mockup.

**QW-451.4
FILLET WELDS QUALIFIED BY GROOVE-WELD TESTS**

Thickness T of Test Coupon (Plate or Pipe) as Welded	Range Qualified	Type and Number of Tests Required
All groove tests	All fillet sizes on all base metal thicknesses and all diameters	Fillet welds are qualified when the groove weld is qualified in accordance with either QW-451.1 or QW-451.2 (see QW-202.2)

A02

**QW-452 Performance Qualification Thickness
Limits and Test Specimens**

QW-452.1 Groove-Weld Transverse-Bend Test.

The following tables identify the required type and number of tests and the thickness of weld metal qualified.

**QW-452.1(a)
TEST SPECIMENS**

Thickness of Weld Metal, in. (mm)	Type and Number of Examinations and Test Specimens Required			
	Visual Examination per QW-302.4	Side Bend QW-462.2 [Note (1)]	Face Bend QW-462.3(a) [Note (1)]	Root Bend QW-462.3(a) [Note (1)]
Less than $\frac{3}{8}$ (10)	X	...	1	1
$\frac{3}{8}$ (10) to less than $\frac{3}{4}$ (19)	X	2 [Note (2)]	Note (2)	Note (2)
$\frac{3}{4}$ (19) and over	X	2

GENERAL NOTE: The "Thickness of Weld Metal" is the total weld metal thickness of all welders and all processes in the test coupon.

NOTES:

- (1) To qualify using positions 5G or 6G, a total of four bend specimens are required. To qualify using a combination of 2G and 5G in a single test coupon, a total of six bend specimens are required. See QW-302.3. The type of bend test shall be based on weld metal thickness.
- (2) One face and root bend may be substituted for the two side bends.

**QW-452.1(b)
THICKNESS OF WELD METAL QUALIFIED**

Thickness, t , of Weld Metal in the Coupon, in. (mm) [Notes (1), (2)]	Thickness of Weld Metal Qualified [Note (3)]
All	$2t$
$\frac{1}{2}$ (13) and over with a minimum of three layers	Maximum to be welded

NOTES:

- (1) When more than one welder and/or more than one process and more than one filler metal F-Number is used to deposit weld metal in a coupon, the thickness, t , of the weld metal in the coupon deposited by each welder with each process and each filler metal F-Number in accordance with the applicable variables under QW-404 shall be determined and used individually in the "Thickness, t , of Weld Metal in the Coupon" column to determine the "Thickness of Weld Metal Qualified."
- (2) Two or more pipe test coupons with different weld metal thickness may be used to determine the weld metal thickness qualified and that thickness may be applied to production welds to the smallest diameter for which the welder is qualified in accordance with QW-452.3.
- (3) Thickness of test coupon of $\frac{3}{4}$ in. (19 mm) or over shall be used for qualifying a combination of three or more welders each of whom may use the same or a different welding process.

**QW-452.2
LONGITUDINAL-BEND TESTS**

Type of Joint	Thickness Test Coupon Welded, in. (mm) [Note (1)]	Thickness t of Deposited Weld Metal Qualified, in. (mm) Max.	Type and Number of Tests Required (Guided-Bend Tests) [Note (2)]	
			Face Bend, QW-462.3(b) [Note (3)]	Root Bend, QW-462.3(b) [Note (3)]
Groove	Up to $\frac{3}{8}$ (10), incl.	$2t$	1	1
Groove	Over $\frac{3}{8}$ (10)	$2t$	1	1

NOTES:

- (1) When using one, two, or more welders, the thickness t of the deposited weld metal for each welder with each process shall be determined and used individually in the Thickness column.
- (2) Thickness of test coupon of $\frac{3}{4}$ in. (19 mm) or over shall be used for qualifying a combination of three or more welders, each of which may use the same or a different welding process.
- (3) Face- and root-bend tests may be used to qualify a combination test of:
 - (a) one welder using two welding processes; or
 - (b) two welders using the same or a different welding process.

**QW-452.3
GROOVE-WELD DIAMETER LIMITS**

Outside Diameter of Test Coupon, in. (mm)	Outside Diameter Qualified, in. (mm)	
	Min.	Max.
Less than 1 (25)	Size welded	Unlimited
1 (25) to less than $2\frac{7}{8}$ (73)	1 (25)	Unlimited
$2\frac{7}{8}$ (73) and over	$2\frac{7}{8}$ (73)	Unlimited

GENERAL NOTES:

- (a) Type and number of tests required shall be in accordance with QW-452.1.
- (b) $2\frac{7}{8}$ in. (73 mm) O.D. is the equivalent of NPS $2\frac{1}{2}$.

**QW-452.4
SMALL DIAMETER FILLET-WELD TEST**

Outside Diameter of Test Coupon, in. (mm)	Minimum Outside Diameter Qualified, in. (mm)	Thickness Qualified
Less than 1 (25)	Size welded	All
1 (25) to less than $2\frac{7}{8}$ (73)	1 (25)	All
$2\frac{7}{8}$ (73) and over	$2\frac{7}{8}$ (73)	All

GENERAL NOTES:

- (a) Type and number of tests required shall be in accordance with QW-452.5.
 (b) $2\frac{7}{8}$ in. (73 mm) O.D. is considered the equivalent of NPS $2\frac{1}{2}$.

**QW-452.5
FILLET-WELD TEST**

Type of Joint	Thickness of Test Coupon as Welded, in. (mm)	Range Qualified	Type and Number of Tests Required [QW-462.4(b) or QW-462.4(c)]	
			Macro	Fracture
Tee fillet	$\frac{3}{16}$ – $\frac{3}{8}$ (4.8–10)	All base material thicknesses, fillet sizes, and diameters $2\frac{7}{8}$ (73) O.D. and over [Note (1)]	1	1
	Less than $\frac{3}{16}$ (4.8)	T to $2T$ base material thickness, T maximum fillet size, and all diameters $2\frac{7}{8}$ (73) O.D. and over [Note (1)]	1	1

GENERAL NOTE: Production assembly mockups may be substituted in accordance with QW-181.2.1. When production assembly mockups are used, range qualified shall be limited to the fillet sizes, base metal thicknesses, and configuration of the mockup.

NOTE:

(1) $2\frac{7}{8}$ in. (73 mm) O.D. is considered the equivalent of NPS $2\frac{1}{2}$. For smaller diameter qualifications, refer to QW-452.4 or QW-452.6.

**QW-452.6
FILLET QUALIFICATION BY GROOVE-WELD TESTS**

Type of Joint	Thickness of Test Coupon as Welded, in. (mm)	Range Qualified	Type and Number of Tests Required
Any groove	All thicknesses	All base material thicknesses, fillet sizes, and diameters	Fillet welds are qualified when a welder/welding operator qualifies on a groove weld test

QW-453
PROCEDURE/PERFORMANCE QUALIFICATION THICKNESS LIMITS AND TEST
SPECIMENS FOR HARD-FACING (WEAR-RESISTANT) AND CORROSION-
RESISTANT OVERLAYS

Thickness of Test Coupon (T)	Corrosion-Resistant [Note (1)] Overlay		Hard-facing Overlay (Wear-Resistant) [Note (2)]	
	Nominal Base Metal Thickness Qualified (T)	Type and Number of Tests Required	Nominal Base Metal Thickness Qualified (T)	Type and Number of Tests Required
Procedure Qualification Testing				
Less than 1 in. (25 mm) T	T qualified to unlimited		T qualified up to 1 in. (25 mm)	
1 in. (25 mm) and over T	1 in. (25 mm) to unlimited	Notes (4), (5), and (9)	1 in. (25 mm) to unlimited	Notes (3), (7), (8), and (9)
Performance Qualification Testing				
Less than 1 in. (25 mm) T	T qualified to unlimited		T qualified to unlimited	
1 in. (25 mm) and over T	1 in. (25 mm) to unlimited	Note (6)	1 in. (25 mm) to unlimited	Notes (8) and (10)

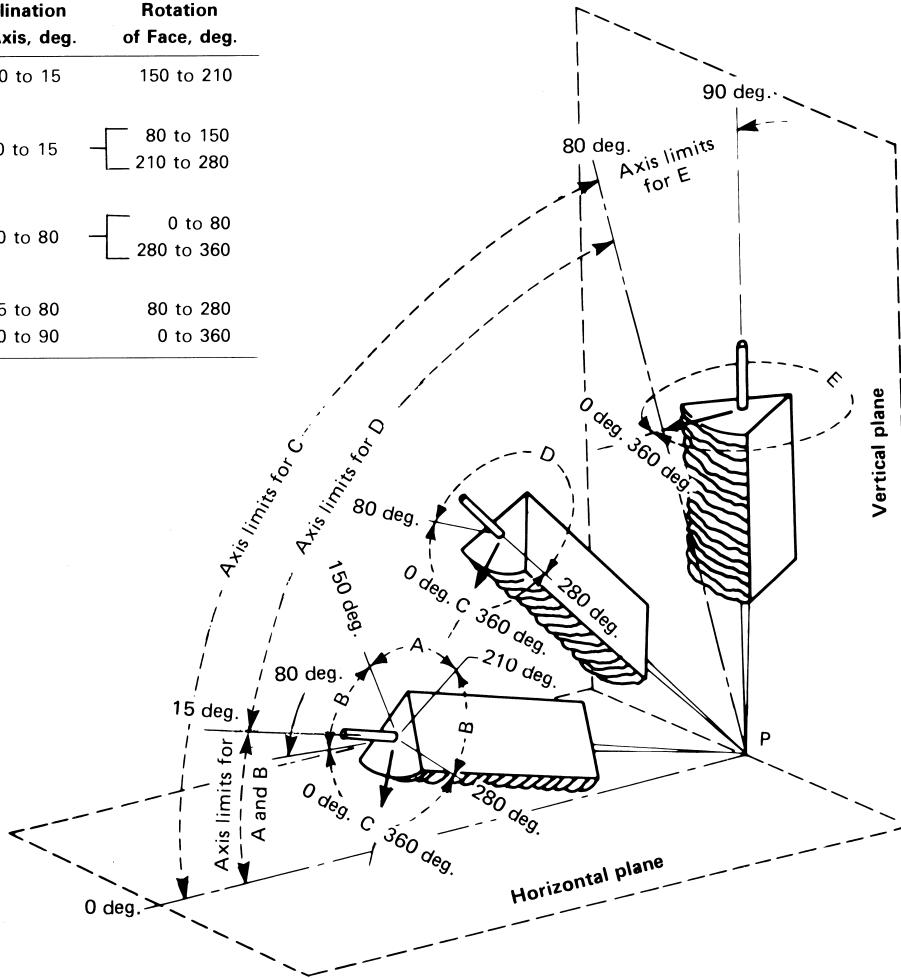

NOTES:

- (1) The qualification test coupon shall consist of base metal not less than 6 in. (152 mm) \times 6 in. (152 mm). The weld overlay cladding shall be a minimum of $1\frac{1}{2}$ in. (38 mm) wide by approximately 6 in. (152 mm) long. For qualification on pipe, the pipe length shall be a minimum of 6 in. (152 mm), and a minimum diameter to allow the required number of test specimens. The weld overlay shall be continuous around the circumference of the test coupon. For processes (performance qualification only) depositing a weld bead width greater than $\frac{1}{2}$ in. (13 mm) wide, the weld overlay shall consist of a minimum of three weld beads in the first layer.
- (2) The test base metal coupon shall have minimum dimensions of 6 in. (152 mm) wide \times approximately 6 in. (152 mm) long with a hard-faced layer a minimum of $1\frac{1}{2}$ in. (38 mm) wide \times 6 in. (152 mm) long. The minimum hard-faced thickness shall be as specified in the Welding Procedure Specification. Alternatively, the qualification may be performed on a test base metal coupon that represents the size of the production part. For qualification on pipe, the pipe length shall be 6 in. (152 mm) minimum, and of a minimum diameter to allow the required number of test specimens. The weld overlay shall be continuous around the circumference of the test coupon.
- (3) The hard-facing surface shall be examined by the liquid penetrant method and shall meet the acceptance standards in QW-195.2 or as specified in the WPS. Surface conditioning prior to liquid penetrant examination is permitted.
- (4) The corrosion-resistant surface shall be examined by the liquid penetrant method and shall meet the acceptance standards as specified in QW-195.
- (5) Following the liquid penetrant examination, four guided side-bend tests shall be made from the test coupon in accordance with QW-161. The test specimens shall be cut so that there are either two specimens parallel and two specimens perpendicular to the direction of the welding, or four specimens perpendicular to the direction of the welding. For coupons that are less than $\frac{3}{8}$ in. (10 mm) thick, the width of the side-bend specimens may be reduced to the thickness of the test coupon. The side-bend specimens shall be removed from locations specified in QW-462.5(c) or QW-462.5(d).
- (6) The test coupon shall be sectioned to make side-bend test specimens perpendicular to the direction of the welding in accordance with QW-161. Test specimens shall be removed at locations specified in QW-462.5(c) or QW-462.5(d).
- (7) After surface conditioning to the minimum thickness specified in the WPS, a minimum of three hardness readings shall be made on each of the specimens from the locations shown in QW-462.5(b) or QW-462.5(e). All readings shall meet the requirements of the WPS.
- (8) The base metal shall be sectioned transversely to the direction of the hard-facing overlay. The two faces of the hard-facing exposed by sectioning shall be polished and etched with a suitable etchant and shall be visually examined with $\times 5$ magnification for cracks in the base metal or the heat-affected zone, lack of fusion, or other linear defects. The overlay and the base metal shall meet the requirements specified in the WPS. All exposed faces shall be examined. See QW-462.5(b) for pipe and QW-462.5(e) for plate.
- (9) When a chemical composition is specified in the WPS, chemical analysis specimens shall be removed at locations specified in QW-462.5(b) or QW-462.5(e). The chemical analysis shall be performed in accordance with QW-462.5(a) and shall be within the range specified in the WPS. This chemical analysis is not required when a chemical composition is not specified on the WPS.
- (10) At a thickness greater than or equal to the minimum thickness specified in the WPS, the weld surface shall be examined by the liquid penetrant method and shall meet the acceptance standards in QW-195.2 or as specified in the WPS. Surface conditioning prior to liquid penetrant examination is permitted.

QW-460 GRAPHICS

QW-461 Positions

Tabulation of Positions of Welds			
Position	Diagram Reference	Inclination of Axis, deg.	Rotation of Face, deg.
Flat	A	0 to 15	150 to 210
Horizontal	B	0 to 15	80 to 150 210 to 280
Overhead	C	0 to 80	0 to 80 280 to 360
Vertical	D	15 to 80	80 to 280
	E	80 to 90	0 to 360

GENERAL NOTE:

The horizontal reference plane is taken to lie always below the weld under consideration.

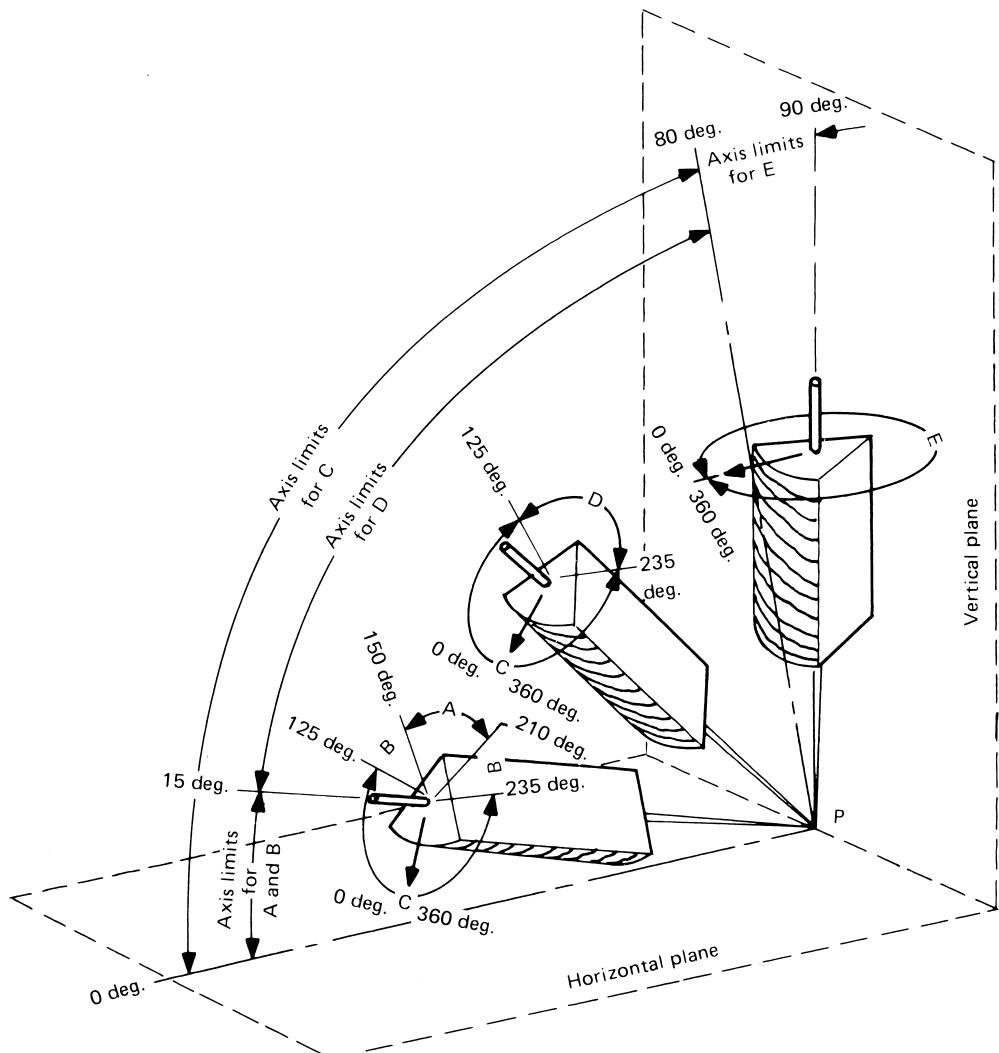

Inclination of axis is measured from the horizontal reference plane toward the vertical.

Angle of rotation of face is measured from a line perpendicular to the axis of the weld and lying in a vertical plane containing this axis. The reference position (0 deg.) of rotation of the face invariably points in the direction opposite to that in which the axis angle increases. The angle of rotation of the face of weld is measured in a clockwise direction from this reference position (0 deg.) when looking at point P.

NOTES:

(1) Positions of welding as shown in QW-461.1 and QW-461.2.

F = Flat

H = Horizontal

V = Vertical

O = Overhead

(2) Pipe 2 $\frac{7}{8}$ in. O.D. and over.

(3) See diameter restrictions in QW-452.3, QW-452.4, and QW-452.6.

QW-462 Test Specimens

The purpose of the QW-462 figures is to give the manufacturer or contractor guidance in dimensioning test specimens for tests required for procedure and performance qualifications. Unless a minimum, maximum, or tolerance is given in the figures (or as QW-150, QW-160, or QW-180 requires), the dimensions

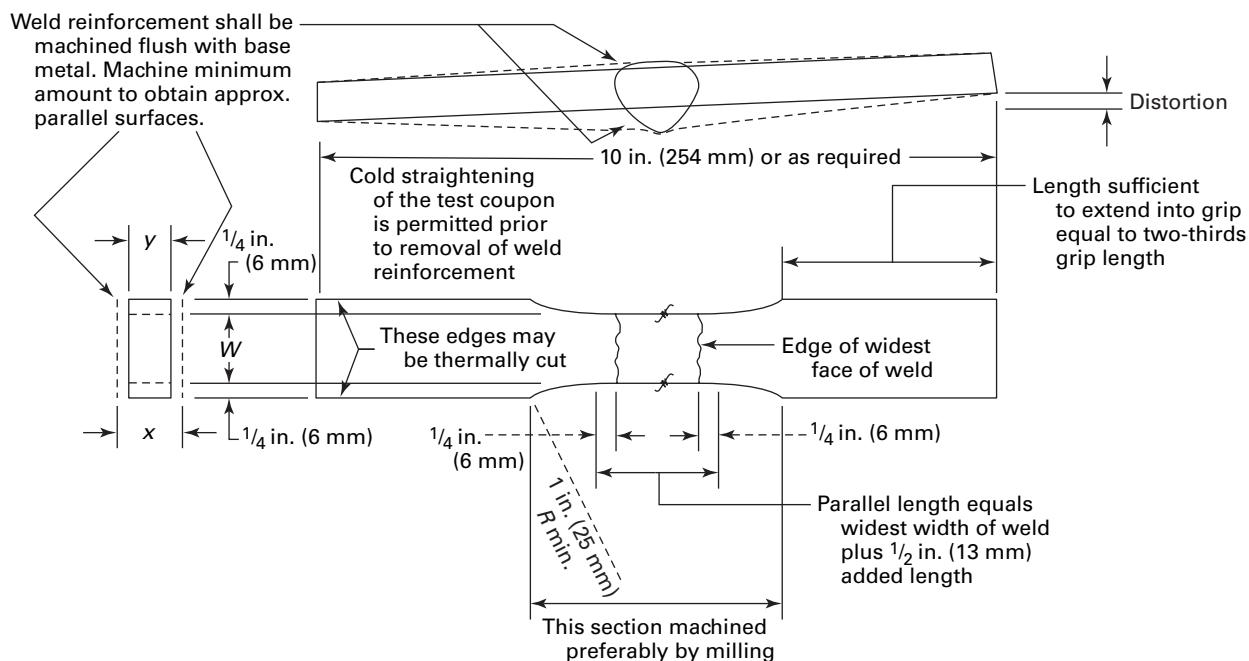

are to be considered approximate. All welding processes and filler material to be qualified must be included in the test specimen.

x = coupon thickness including reinforcement

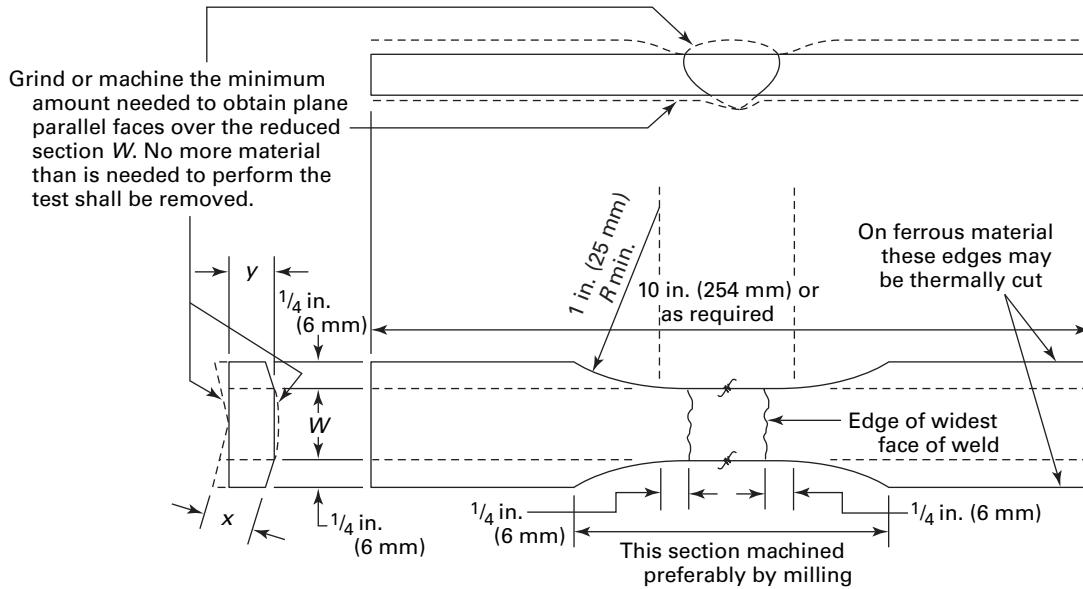

y = specimen thickness

T = coupon thickness excluding reinforcement

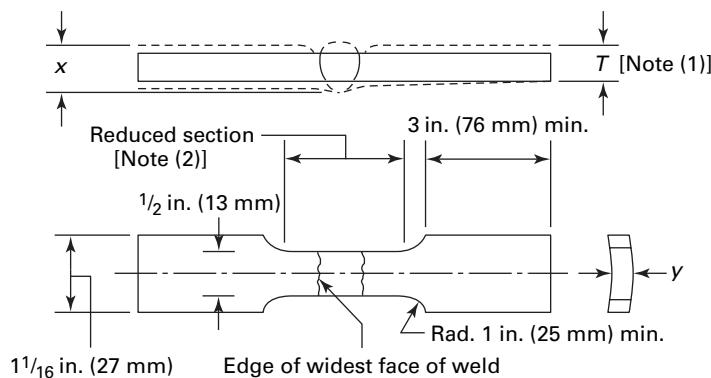

W = specimen width, $\frac{3}{4}$ in. (19 mm)

QW-462.1(a) TENSION — REDUCED SECTION — PLATE

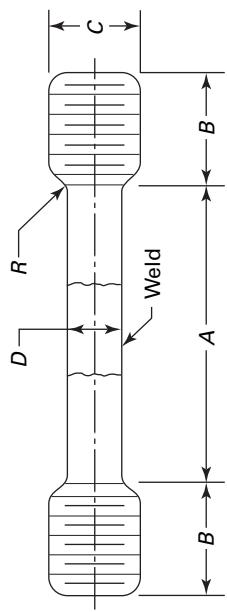

QW-462.1(b) TENSION — REDUCED SECTION — PIPE

NOTES:

- (1) The weld reinforcement shall be ground or machined so that the weld thickness does not exceed the base metal thickness T . Machine minimum amount to obtain approximately parallel surfaces.
- (2) The reduced section shall not be less than the width of the weld plus $2y$.

QW-462.1(c) TENSION — REDUCED SECTION ALTERNATE FOR PIPE

	Standard Dimensions, in. (mm)		
	(a) 0.505 Specimen	(b) 0.353 Specimen	(c) 0.252 Specimen
A—Length of reduced section	Note (1)	Note (1)	Note (1)
D—Diameter	0.500 ± 0.010 (12.7 ± 0.25)	0.350 ± 0.007 (8.89 ± 0.18)	0.250 ± 0.005 (6.35 ± 0.13)
R—Radius of fillet	$\frac{3}{8}$ (9.6) min.	$\frac{1}{4}$ (6.4) min.	$\frac{3}{16}$ (4.8) min.
B—Length of end section	$\frac{1}{8}$ (35) approx.	$\frac{1}{8}$ (29) approx.	$\frac{7}{8}$ (22) approx.
C—Diameter of end section	$\frac{3}{4}$ (19)	$\frac{1}{2}$ (13)	$\frac{3}{8}$ (10)
			Note (1)
			0.188 ± 0.003 (4.78 ± 0.08)
			$\frac{1}{8}$ (3.2) min.
			$\frac{1}{2}$ (13) approx.
			$\frac{1}{4}$ (6)

GENERAL NOTES:

- (a) Use maximum diameter specimen (a), (b), (c), or (d) that can be cut from the section.
- (b) Weld should be in center of reduced section.
- (c) Where only a single coupon is required, the center of the specimen should be midway between the surfaces.
- (d) The ends may be of any shape to fit the holders of the testing machine in such a way that the load is applied axially.

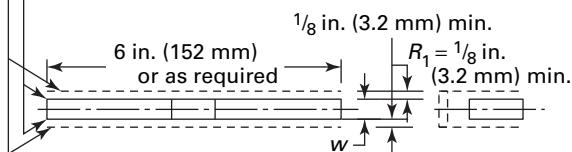

NOTE:

- (1) Reduced section A should not be less than width of weld plus $2D$.

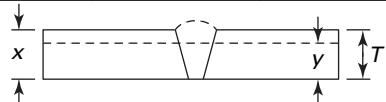

QW-462.1(e) TENSION — FULL SECTION — SMALL DIAMETER PIPE

- (1a) For procedure qualification of materials other than P-No. 1 in QW-422, if the surfaces of the side bend test specimens are gas cut, removal by machining or grinding of not less than $\frac{1}{8}$ in. (3.2 mm) from the surface shall be required.
- (1b) Such removal is not required for P-No. 1 materials, but any resulting roughness shall be dressed by machining or grinding.
- (2) For performance qualification of all materials in QW-422, if the surfaces of side bend tests are gas cut, any resulting roughness shall be dressed by machining or grinding.

T , in. (mm)	y , in. (mm)	w , in. (mm)	
		P-No. 23, F-No. 23, or P-No. 35	All other metals
$\frac{3}{8}$ to $1\frac{1}{2}$ (10 to 38), incl.	T	$\frac{1}{8}$ (3.2)	$\frac{3}{8}$ (10)
$>1\frac{1}{2}$ (38)	Note (1)	$\frac{1}{8}$ (3.2)	$\frac{3}{8}$ (10)

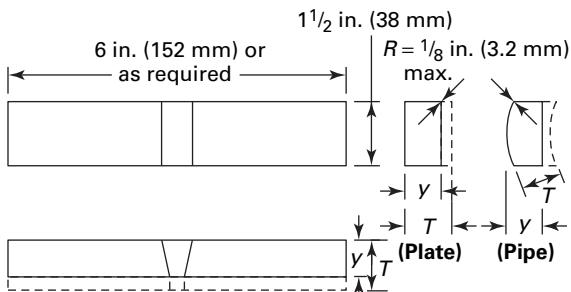

GENERAL NOTE: Weld reinforcement and backing strip or backing ring, if any, may be removed flush with the surface of the specimen. Thermal cutting, machining, or grinding may be employed. Cold straightening is permitted prior to removal of the reinforcement.

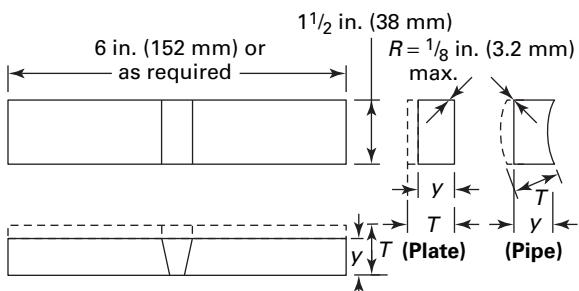

NOTE:

- (1) When specimen thickness T exceeds $1\frac{1}{2}$ in. (38 mm), use one of the following.
 - (a) Cut specimen into multiple test specimens y of approximately equal dimensions [$\frac{3}{4}$ in. (19 mm) to $1\frac{1}{2}$ in. (38 mm)]. y = tested specimen thickness when multiple specimens are taken from one coupon.
 - (b) The specimen may be bent at full width. See requirements on jig width in QW-466.1.

QW-462.2 SIDE BEND

Face-Bend Specimen — Plate and Pipe

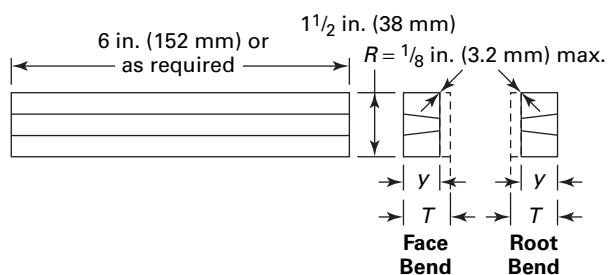

Root-Bend Specimen — Plate and Pipe

T , in. (mm)	Y , in. (mm)	
	P-No. 23, F-No. 23, or P-No. 35	All Other Metals
$\frac{1}{16} < \frac{1}{8}$ (1.6 < 3.2)	T	T
$\frac{1}{8} - \frac{3}{8}$ (3.2-10)	$\frac{1}{8}$ (3.2)	T
$> \frac{3}{8}$ (10)	$\frac{1}{8}$ (3.2)	$\frac{3}{8}$ (10)

GENERAL NOTES:

- (a) Weld reinforcement and backing strip or backing ring, if any, shall be removed flush with the surface of the specimen. If a recessed ring is used, this surface of the specimen may be machined to a depth not exceeding the depth of the recess to remove the ring, except that in such cases the thickness of the finished specimen shall be that specified above. Do not flame-cut nonferrous material.
- (b) If the pipe being tested is 4 in. (102 mm) nominal diameter or less, the width of the bend specimen may be $\frac{3}{4}$ in. (19 mm) for pipe diameters 2 in. (DN50) to and including 4 in. (DN 100). The bend specimen width may be $\frac{3}{8}$ in. (10 mm) for pipe diameters less than 2 in. (DN50) down to and including $\frac{3}{8}$ in. (10 mm) and as an alternative, if the pipe being tested is equal to or less than 1 in. (25 mm) nominal pipe size (1.315 in. O. D.) (DN25), the width of the bend specimens may be that obtained by cutting the pipe into quarter sections, less an allowance for saw cuts or machine cutting. These specimens cut into quarter sections are not required to have one surface machined flat as shown in QW-462.3(a). Bend specimens taken from tubing of comparable sizes may be handled in a similar manner.

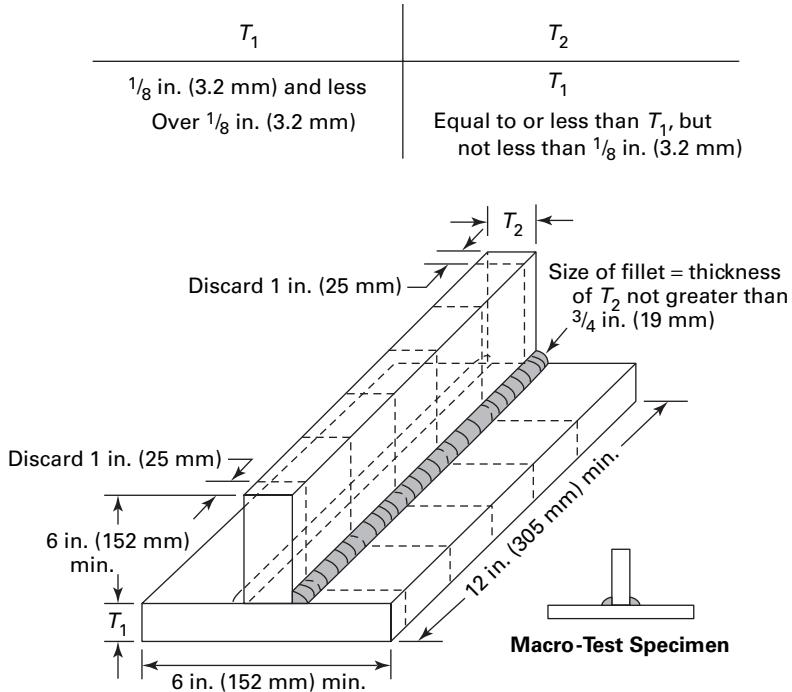

QW-462.3(a) FACE AND ROOT BENDS — TRANSVERSE

T , in. (mm)	Y , in. (mm)	P-No. 23, F-No. 23, or P-No. 35	All Other Metals
$\frac{1}{16} < \frac{1}{8}$ (1.6 < 3.2)	T	T	T
$\frac{1}{8} - \frac{3}{8}$ (3.2-10)	$\frac{1}{8}$ (3.2)	$\frac{1}{8}$ (3.2)	$\frac{1}{8}$ (3.2)
$> \frac{3}{8}$ (10)	$\frac{1}{8}$ (3.2)	$\frac{3}{8}$ (10)	$\frac{3}{8}$ (10)

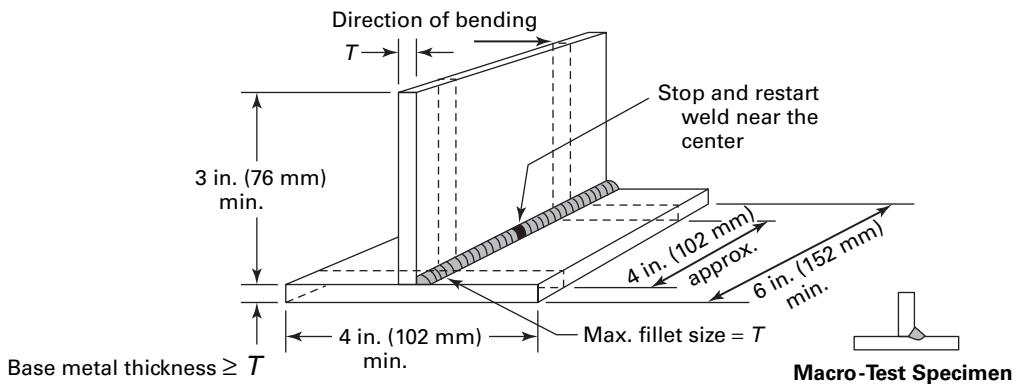

GENERAL NOTE: Weld reinforcements and backing strip or backing ring, if any, shall be removed essentially flush with the undisturbed surface of the base material. If a recessed strip is used, this surface of the specimen may be machined to a depth not exceeding the depth of the recess to remove the strip, except that in such cases the thickness of the finished specimen shall be that specified above.

QW-462.3(b) FACE AND ROOT BENDS — LONGITUDINAL

GENERAL NOTE: Macro-test — the fillet shall show fusion at the root of the weld but not necessarily beyond the root. The weld metal and heat-affected zone shall be free of cracks.

QW-462.4(a) FILLET WELDS — PROCEDURE

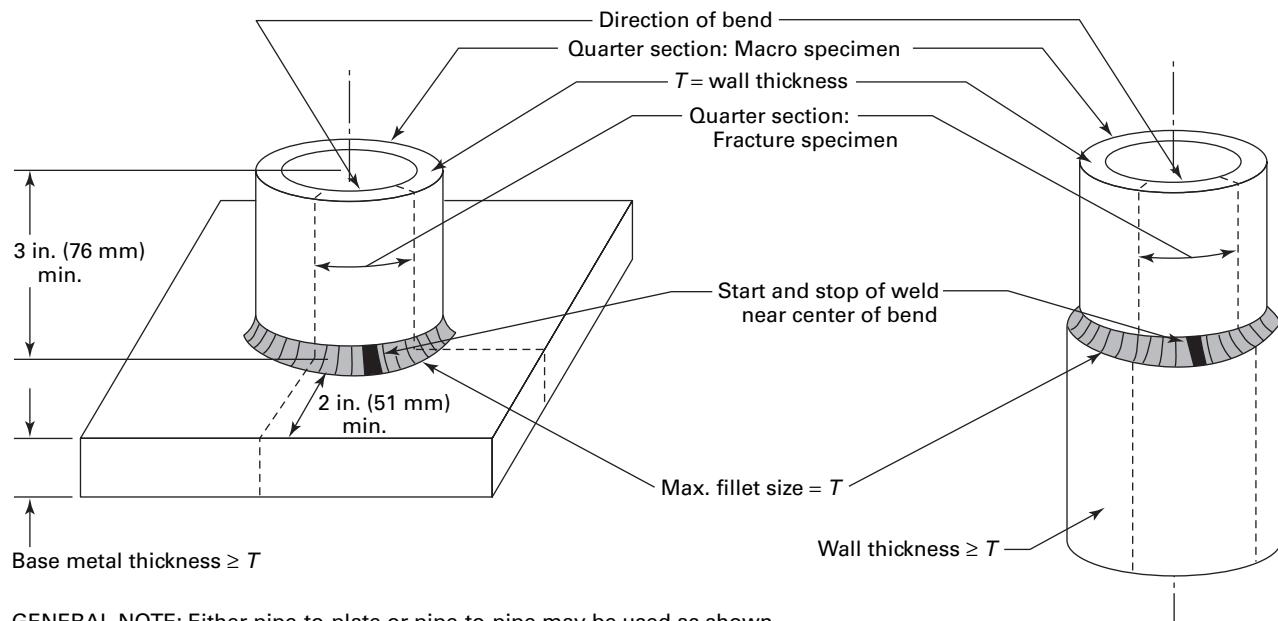

GENERAL NOTE: Refer to QW-452.5 for T thickness/qualification ranges.

QW-462.4(b) FILLET WELDS — PERFORMANCE

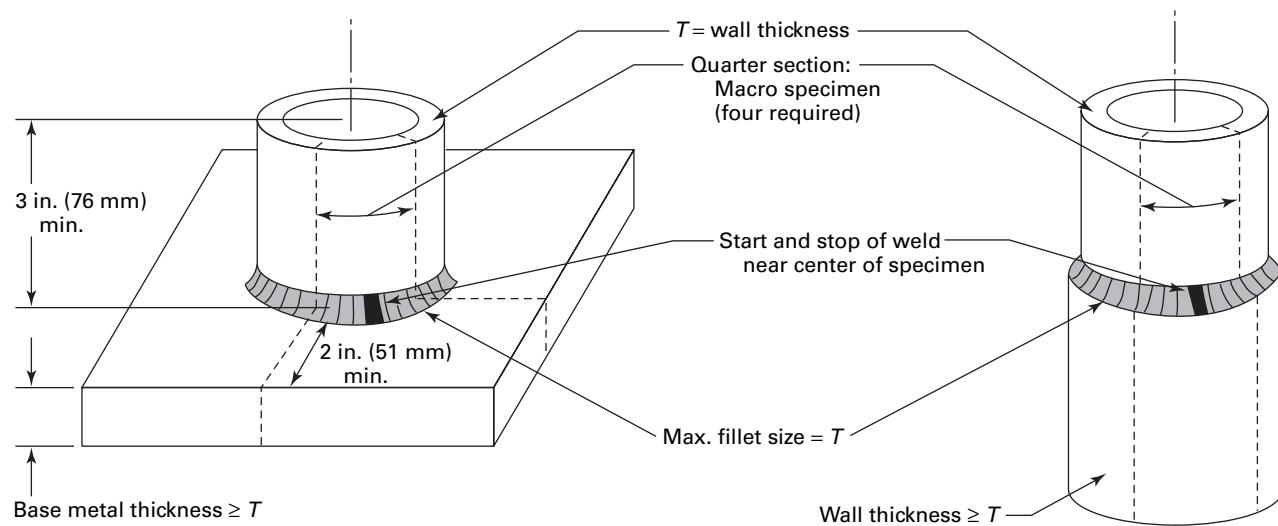

QW-462.4(c)

WELDING DATA

QW-462.4(d)

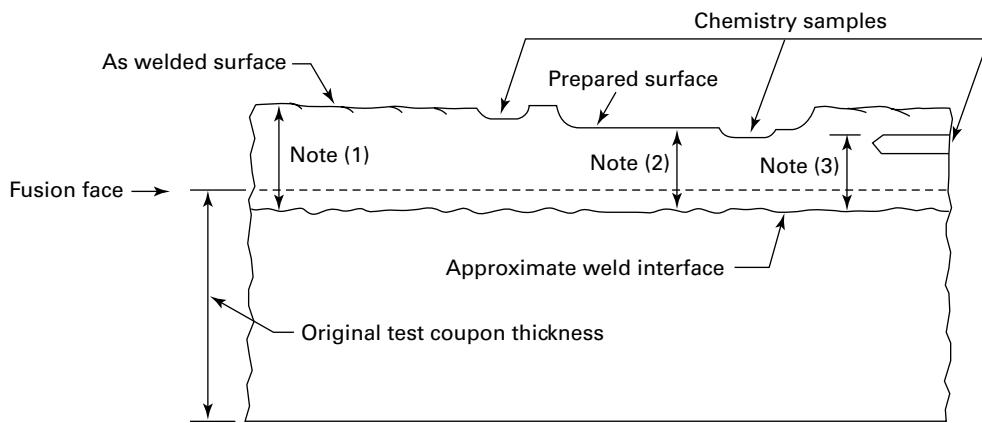

QW-462.4(c) FILLET WELDS IN PIPE — PERFORMANCE

GENERAL NOTES:

- Either pipe-to-plate or pipe-to-pipe may be used as shown.
- Macro test:
 - The fillet shall show fusion at the root of the weld but not necessarily beyond the root.
 - The weld metal and the heat-affected zone shall be free of cracks.

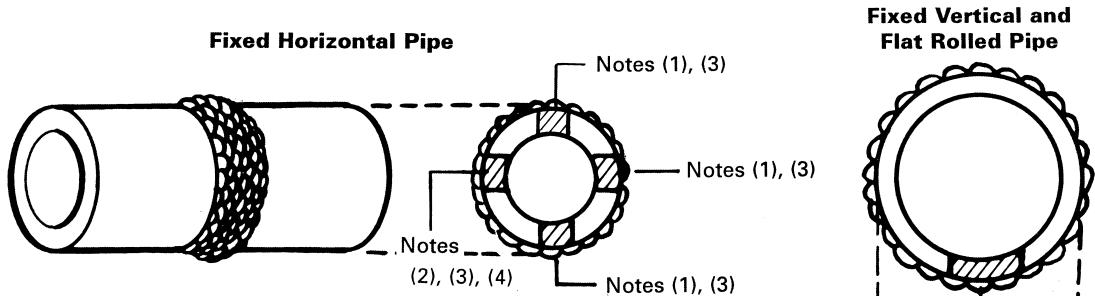

QW-462.4(d) FILLET WELDS IN PIPE — PROCEDURE

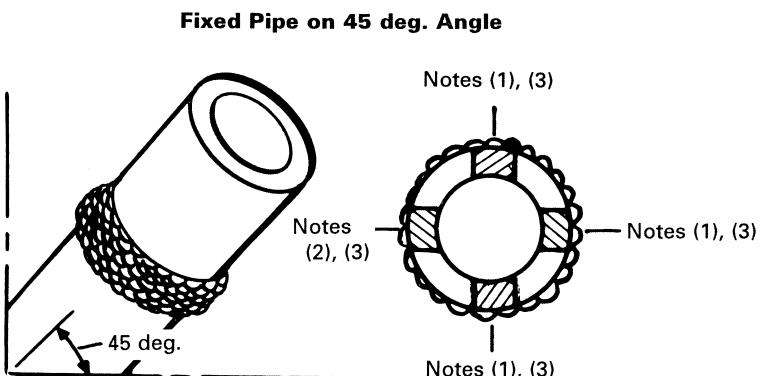

NOTES:

- (1) When a chemical analysis or hardness test is conducted on the as welded surface, the distance from the approximate weld interface to the final as welded surface shall become the minimum qualified overlay thickness. The chemical analysis may be performed directly on the as welded surface or on chips of material taken from the as welded surface.
- (2) When a chemical analysis or hardness test is conducted after material has been removed from the as welded surface, the distance from the approximate weld interface to the prepared surface shall become the minimum qualified overlay thickness. The chemical analysis may be made directly on the prepared surface or from chips removed from the prepared surface.
- (3) When a chemical analysis test is conducted on material removed by a horizontal drilled sample, the distance from the approximate weld interface to the uppermost side of the drilled cavity shall become the minimum qualified overlay thickness. The chemical analysis shall be performed on chips of material removed from the drilled cavity.

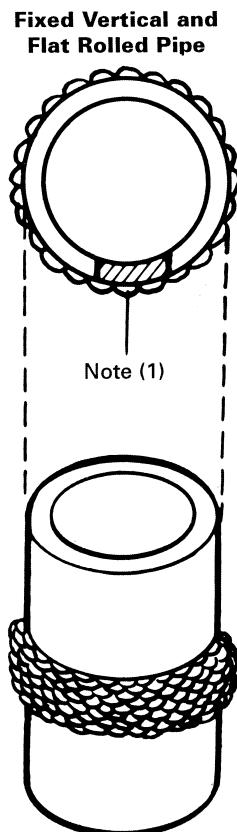

QW-462.5(a) CHEMICAL ANALYSIS AND HARDNESS SPECIMEN CORROSION-RESISTANT AND HARD-FACING WELD METAL OVERLAY

Test Specimen Location for 5G Overlay Qualification
(Specimens Required From a Minimum of Three Locations)

Test Specimen Location for 6G Overlay Qualification
(Specimens Required From a Minimum of Three Locations)

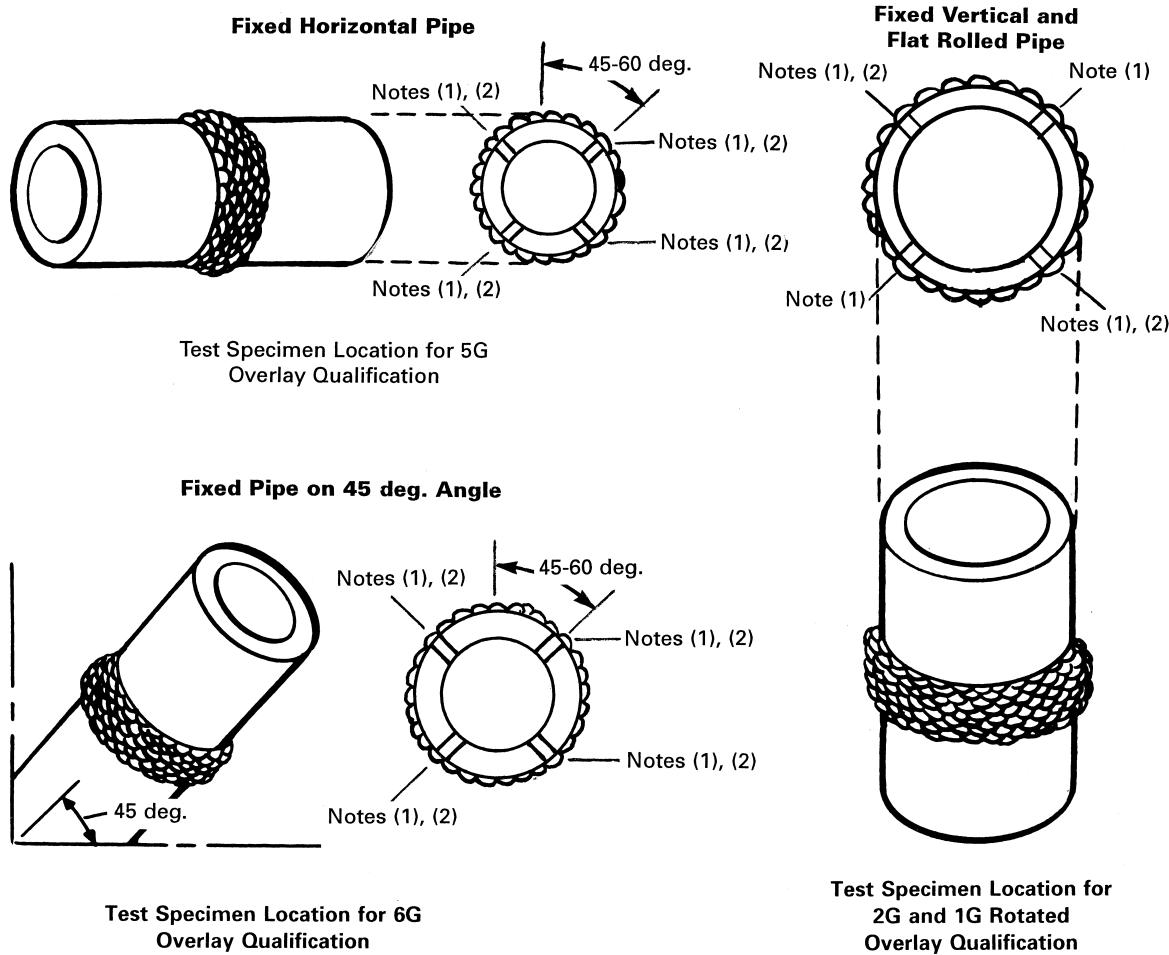

Test Specimen Location for
2G and 1G Rotated Overlay Qualification
(Specimens Required From One Location)

GENERAL NOTE: Overlay may be on the inside or outside of pipe.

NOTES:

- (1) Location for required test specimen removal (QW-453.).
- (2) Testing of circumferential hardfacing weld metal on pipe procedure qualification coupons may be limited to a single segment (completed utilizing the vertical, up-hill progression) for the chemical analysis, hardness, and macro-etch tests required in QW-453. Removal is required for a change from vertical down to vertical up-hill progression (but not vice-versa).
- (3) Location of test specimens shall be in accordance with the angular position limitations of QW-120.
- (4) When overlay welding is performed using machine or automatic welding and the vertical travel direction of adjacent weld beads is reversed on alternate passes, only one chemical analysis or hardness specimen is required to represent the vertical portion. Qualification is then restricted in production to require alternate pass reversal of rotation direction method.

**QW-462.5(b) CHEMICAL ANALYSIS SPECIMEN, HARD-FACING OVERLAY HARDNESS,
AND MACRO TEST LOCATION(S) FOR CORROSION-RESISTANT AND HARD-FACING
WELD METAL OVERLAY**

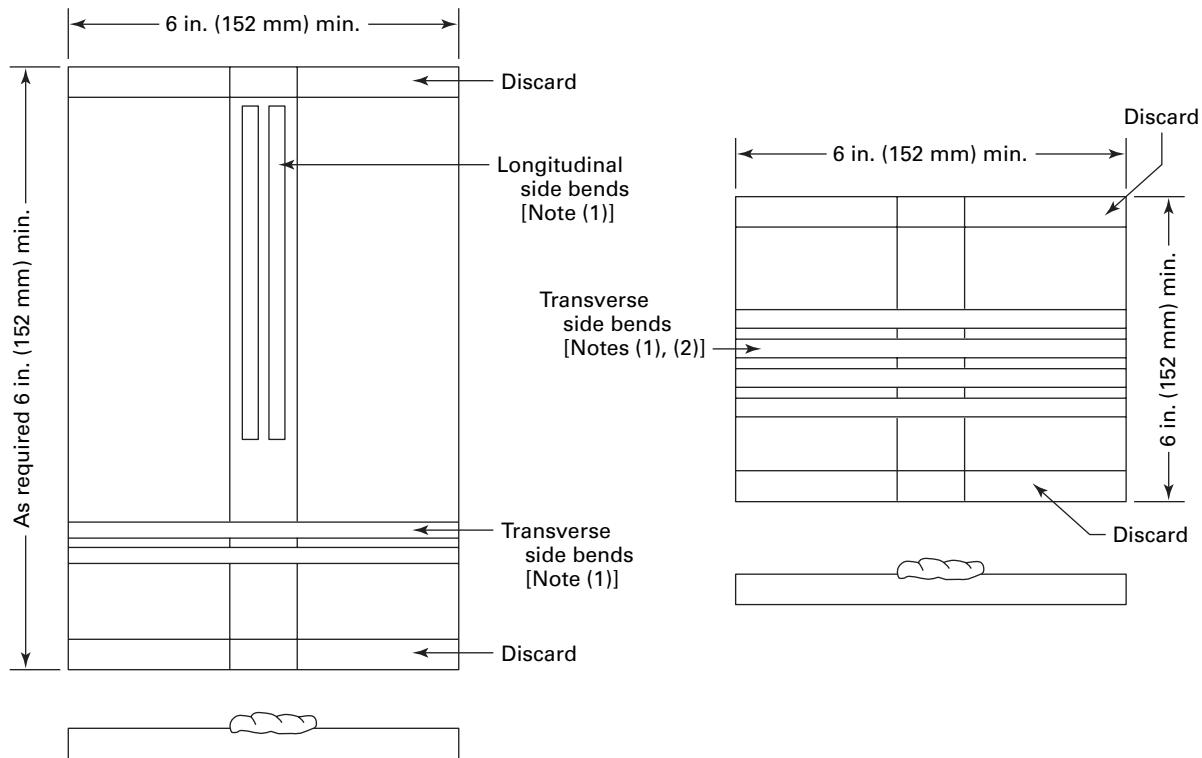

GENERAL NOTE: Overlay may be on the inside or outside of pipe.

NOTES:

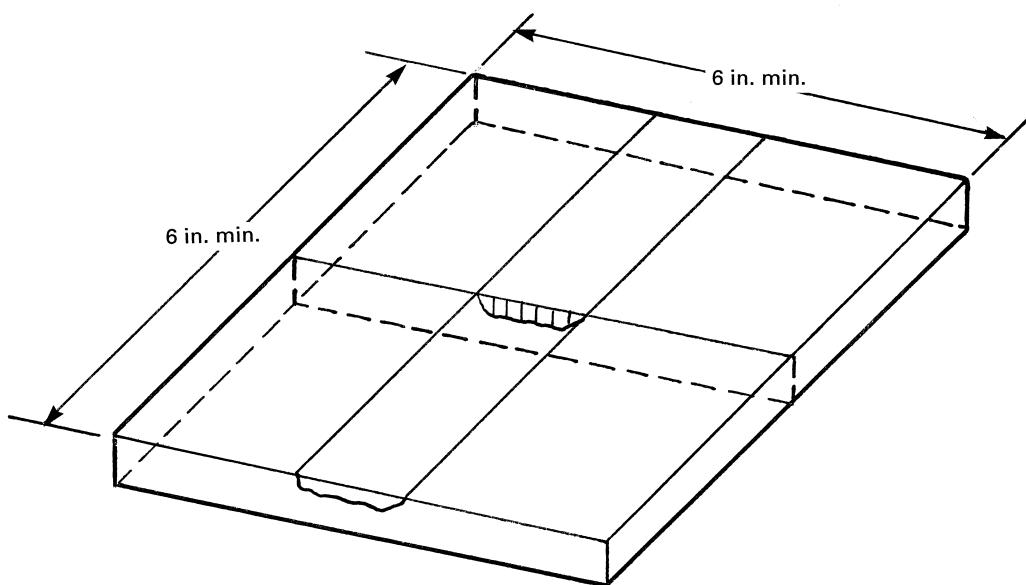

- (1) Location for required test specimen removal — Procedure (QW-453).
- (2) Location for required test specimen removal — Performance (QW-453).

QW-462.5(c) PIPE BEND SPECIMEN — CORROSION-RESISTANT WELD METAL OVERLAY

**NOTES:**

- (1) Location for required test specimen removal — Procedure (QW-453). Four-side-bend test specimens are required for each position.
- (2) Location for required test specimen removal — Performance (QW-453). Two-side-bend test specimens are required for each position.

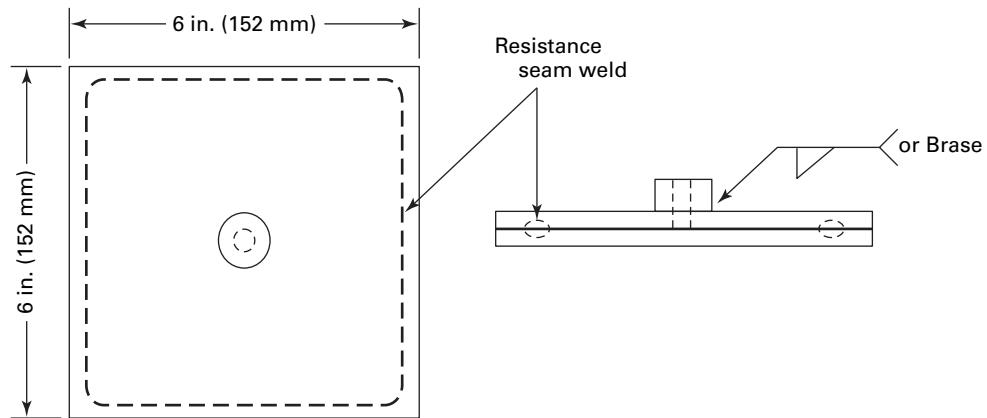

QW-462.5(d) PLATE BEND SPECIMENS — CORROSION-RESISTANT WELD METAL OVERLAY

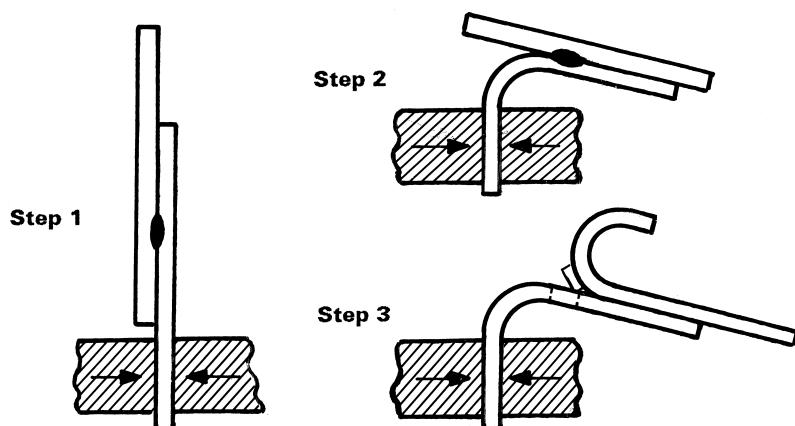

GENERAL NOTES:

- (a) Location for required test specimen removal. One required for each position.
- (b) Removal required for a change from vertical up to vertical down and vice versa.

QW-462.5(e) PLATE MACRO, HARDNESS, AND CHEMICAL ANALYSIS SPECIMENS — CORROSION-RESISTANT AND HARD-FACING WELD METAL OVERLAY

QW-462.7 RESISTANCE SEAM WELD

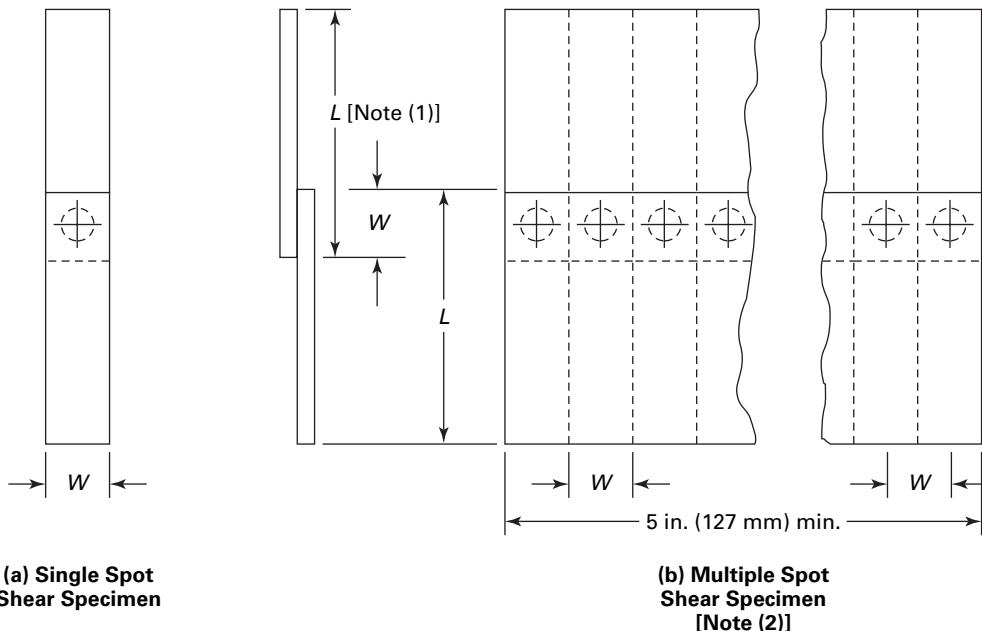

Peel Test

Step 1 - Grip in vise or other suitable device.

Step 2 - Bend specimen.

Step 3 - Peel pieces apart with pincers or other suitable tool.

QW-462.8 SPOT WELDS IN SHEETS

Nominal Thickness of Thinner Sheet, in. (mm)	W , in. (mm) Min.
Over 0.008 to 0.030 (0.20 to 0.76)	0.68 (17.3)
Over 0.030 to 0.100 (0.76 to 2.54)	1.00 (25.4)
Over 0.100 to 0.130 (2.54 to 3.30)	1.25 (31.8)
Over 0.130 (3.30)	1.50 (38.1)

NOTES:

- (1) L shall be not less than $4W$.
- (2) Sketch (b) shall be made of 5 specimens or more.

All others with greater than or equal to 20% elongation	9.5 $t = 9.5$ or less	38.1 $4t$	19.0 $2t$	60.4 $6t + 3.2$	30.2 $3t + 1.6$
All others with less than 20% elongation	$t =$ (see Note b)	$32\frac{7}{8}t$, max.	$16\frac{7}{16}t$, max.	$34\frac{7}{8}t + 1.6$, max.	$17\frac{7}{16}t + 0.8$, max.

GENERAL NOTES:

- (a) For P-Numbers, see QW-422; for F-Numbers, see QW-432.
 (b) The dimensions of the test jig shall be such as to give the bend test specimen a calculated percent outer fiber elongation equal to at least that of the base material with the lower minimum elongation as specified in the base material specification.

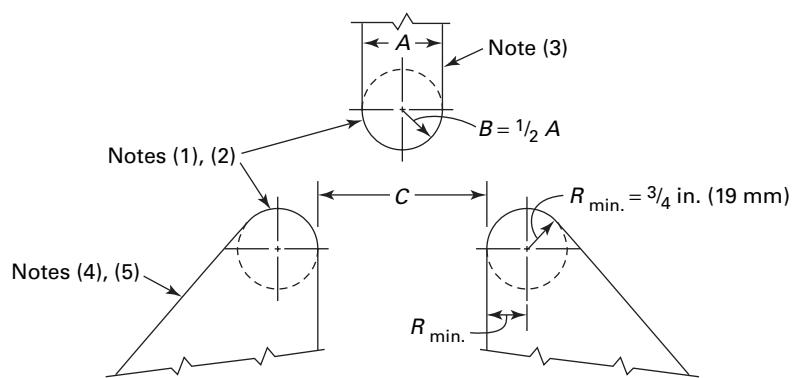

$$\text{percent outer fiber elongation} = \frac{100t}{A + t}$$

The following formula is provided for convenience in calculating the bend specimen thickness:

$$\text{thickness of specimen } (t) = \frac{A \times \text{percent elongation}}{[100 - (\text{percent elongation})]}$$

- (c) For guided-bend jig configuration, see QW-466.2, QW-466.3, and QW-466.4.
 (d) The weld and heat-affected zone, in the case of a transverse weld bend specimen, shall be completely within the bend portion of the specimen after testing.

QW-466.1 TEST JIG DIMENSIONS (CONT'D)

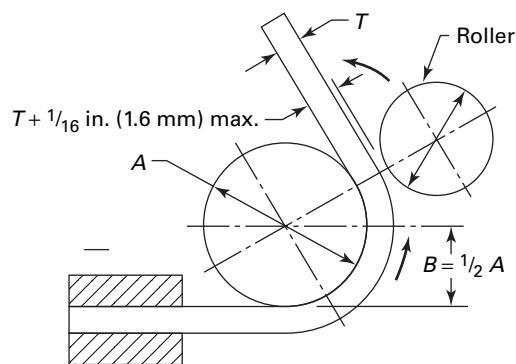

GENERAL NOTE: See QW-466.1 for jig dimensions and general notes.

NOTES:

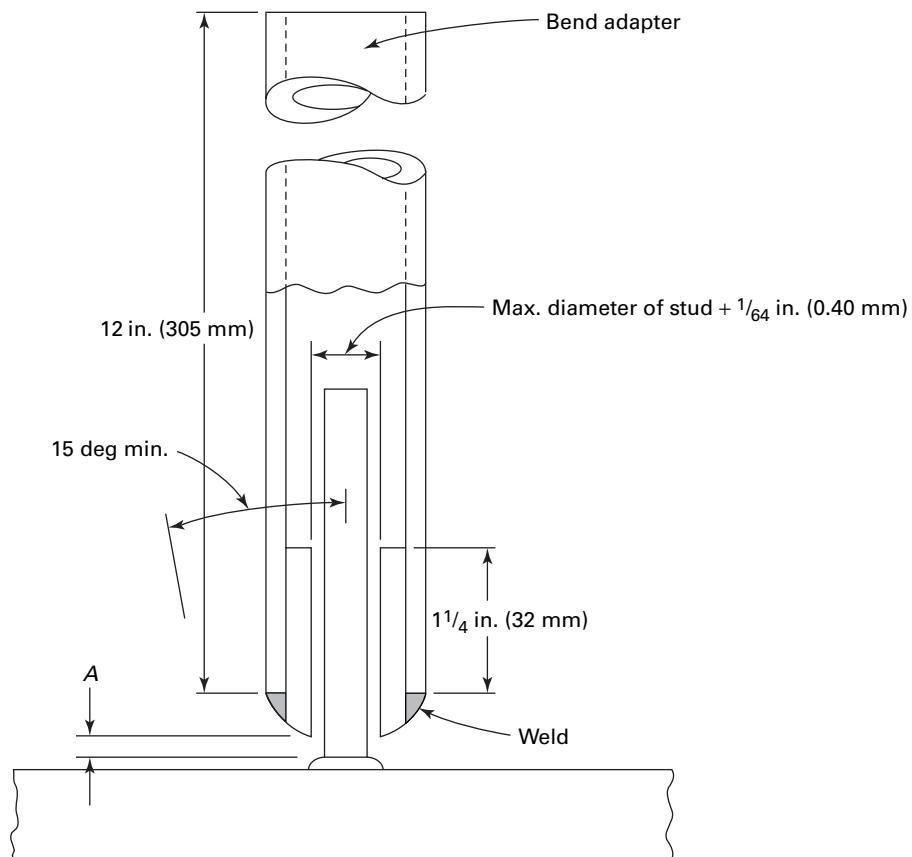

- (1) Either hardened and greased shoulders or hardened rollers free to rotate shall be used.
- (2) The shoulders or rollers shall have a minimum bearing surface of 2 in. (51 mm) for placement of the specimen. The rollers shall be high enough above the bottom of the jig so that the specimens will clear the rollers when the ram is in the low position.
- (3) The ram shall be fitted with an appropriate base and provision made for attachment to the testing machine, and shall be of a sufficiently rigid design to prevent deflection and misalignment while making the bend test. The body of the ram may be less than the dimensions shown in column A of QW-466.1.
- (4) If desired, either the rollers or the roller supports may be made adjustable in the horizontal direction so that specimens of t thickness may be tested on the same jig.
- (5) The roller supports shall be fitted with an appropriate base designed to safeguard against deflection and misalignment and equipped with means for maintaining the rollers centered midpoint and aligned with respect to the ram.

QW-466.2 GUIDED-BEND ROLLER JIG

**GENERAL NOTES:**

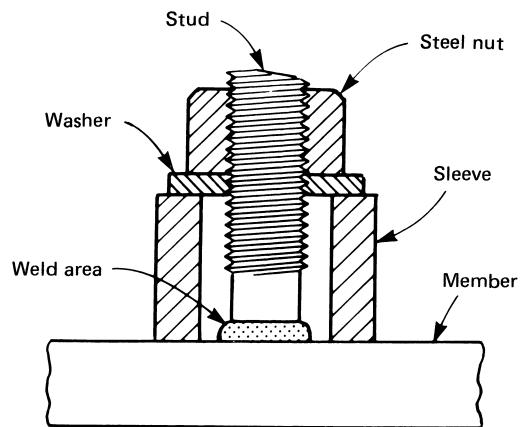

- (a) See QW-466.1 for jig dimensions and other general notes.
- (b) Dimensions not shown are the option of the designer. The essential consideration is to have adequate rigidity so that the jig parts will not spring.
- (c) The specimen shall be firmly clamped on one end so that there is no sliding of the specimen during the bending operation.
- (d) Test specimens shall be removed from the jig when the outer roll has been removed 180 deg from the starting point.

QW-466.3 GUIDED-BEND WRAP AROUND JIG

For Stud Diameter, in. (mm)	Use Adapter Gap, <i>A</i> , in. (mm)
1/8 (3.2)	1/8 (3.2)
3/16 (4.8)	1/8 (3.2)
1/4 (6)	3/16 (4.8)
3/8 (10)	7/32 (5.6)
1/2 (13)	5/16 (8)
5/8 (16)	11/32 (9)
3/4 (19)	15/32 (12)
7/8 (22)	15/32 (12)
1 (25)	19/32 (15)

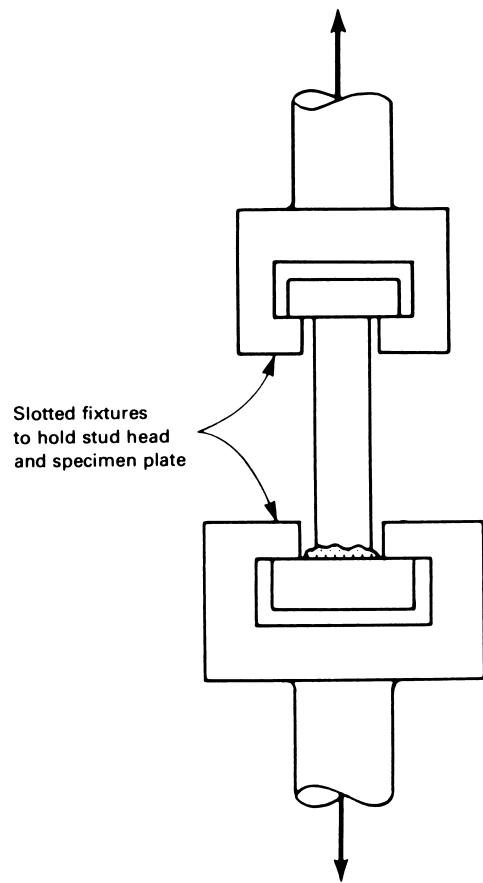

QW-466.4 STUD-WELD BEND JIG

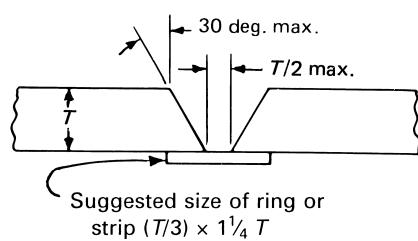

GENERAL NOTES:

- (a) Dimensions are appropriate to the size of the stud.
- (b) Threads of the stud shall be clean and free of lubricant other than residual cutting oil.

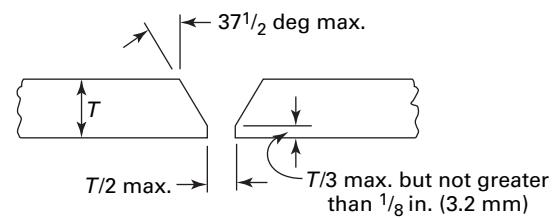

QW-466.5 TORQUE TESTING ARRANGEMENT FOR STUD WELDS

QW-466.6 SUGGESTED TYPE TENSILE TEST FIGURE FOR STUD WELDS

QW-469.1 BUTT JOINT

QW-469.2 ALTERNATIVE BUTT JOINT

QW-470 ETCHING — PROCESSES AND REAGENTS

QW-471 General

The surfaces to be etched should be smoothed by filing, machining, or grinding on metallographic papers. With different alloys and tempers, the etching period will vary from a few seconds to several minutes, and should be continued until the desired contrast is obtained. As a protection from the fumes liberated during the etching process, this work should be done under a hood. After etching, the specimens should be thoroughly rinsed and then dried with a blast of warm air. Coating the surface with a thin clear lacquer will preserve the appearance.

QW-472 For Ferrous Metals

Etching solutions suitable for carbon and low alloy steels, together with directions for their use, are suggested as follows.

QW-472.1 Hydrochloric Acid. Hydrochloric (muriatic) acid and water, equal parts, by volume. The solution should be kept at or near the boiling temperature during the etching process. The specimens are to be immersed in the solution for a sufficient period of time to reveal all lack of soundness that might exist at their cross-sectional surfaces.

QW-472.2 Ammonium Persulfate. One part of ammonium persulfate to nine parts of water, by weight. The solution should be used at room temperature, and should be applied by vigorously rubbing the surface to be etched with a piece of cotton saturated with the solution. The etching process should be continued until there is a clear definition of the structure in the weld.

QW-472.3 Iodine and Potassium Iodide. One part of powdered iodine (solid form), two parts of powdered potassium iodide, and ten parts of water, all by weight. The solution should be used at room temperature, and brushed on the surface to be etched until there is a clear definition or outline of the weld.

QW-472.4 Nitric Acid. One part of nitric acid and three parts of water, by volume.

CAUTION: Always pour the acid into the water. Nitric acid causes bad stains and severe burns.

The solution may be used at room temperature and applied to the surface to be etched with a glass stirring rod. The specimens may also be placed in a boiling solution of the acid, but the work should be done in a well-ventilated room. The etching process should be

continued for a sufficient period of time to reveal all lack of soundness that might exist at the cross-sectional surfaces of the weld.

QW-473 For Nonferrous Metals

The following etching reagents and directions for their use are suggested for revealing the macrostructure.

QW-473.1 Aluminum and Aluminum-Base Alloys

Hydrochloric acid (concentrated)	15 ml
Hydrofluoric acid (48%)	10 ml
Water	85 ml

This solution is to be used at room temperature, and etching is accomplished by either swabbing or immersing the specimen.

QW-473.2 For Copper and Copper-Base Alloys:

Cold Concentrated Nitric Acid. Etching is accomplished by either flooding or immersing the specimen for several seconds under a hood. After rinsing with a flood of water, the process is repeated with a 50-50 solution of concentrated nitric acid and water.

In the case of the silicon bronze alloys, it may be necessary to swab the surface to remove a white (SiO_2) deposit.

QW-473.3 For Nickel and Nickel-Base Alloys

Material	Formula
Nickel	Nitric Acid or Lepito's Etch
Low Carbon Nickel	Nitric Acid or Lepito's Etch
Nickel-Copper (400)	Nitric Acid or Lepito's Etch
Nickel-Chromium-Iron (600 and 800)	Aqua Regia or Lepito's Etch

MAKEUP OF FORMULAS FOR AQUA REGIA AND LEPITO'S ETCH

	Aqua Regia [(1), (3)]	Lepito's Etch [(2), (3)]
Nitric Acid, Concentrated — HNO_3	1 part	3 ml
Hydrochloric Acid, Concentrated — HCl	2 parts	10 ml
Ammonium Sulfate — $(\text{NH}_4)_2(\text{SO}_4)$...	1.5 g
Ferric Chloride — FeCl_3	...	2.5 g
Water	...	7.5 ml

NOTES:

- (1) Warm the parts for faster action.
- (2) Mix solution as follows:
 - (a) Dissolve $(\text{NH}_4)_2(\text{SO}_4)$ in H_2O .
 - (b) Dissolve powdered FeCl_3 in warm HCl.
 - (c) Mix (a) and (b) above and add HNO_3 .
- (3) Etching is accomplished by either swabbing or immersing the specimen.

QW-473.4 For Titanium

	Kroll's Etch	Keller's Etch
Hydrofluoric acid (48%)	1 to 3 ml	$\frac{1}{2}$ ml
Nitric acid (concentrated)	2 to 6 ml	$2\frac{1}{2}$ ml
Hydrochloric Acid (concentrated)	...	$1\frac{1}{2}$ ml
Water	To make 100 ml	To make 100 ml

QW-473.5 For Zirconium

Hydrofluoric acid	3 ml
Nitric acid (concentrated)	22 ml
Water	22 ml

Apply by swab and rinse in cold water.

These are general purpose etchants which are applied at room temperature by swabbing or immersion of the specimen.

QW-490 DEFINITIONS**QW/QB-491 General**

Definitions of the more common terms relating to welding/brazing are defined in QW/QB-492. These are identical to, or substantially in agreement with the definitions of the American Welding Society document, AWS A3.0, Standard Welding Terms and Definitions. There are terms listed that are specific to ASME Section IX and are not presently defined in AWS A3.0. Several definitions have been modified slightly from A3.0 so as to better define the context/intent as used in ASME Section IX.

QW/QB-492 Definitions

arc seam weld — a seam weld made by an arc welding process

arc spot weld — a spot weld made by an arc welding process

arc strike — any inadvertent discontinuity resulting from an arc, consisting of any localized remelted metal, heat-affected metal, or change in the surface profile of any metal object. The arc may be caused by arc welding electrodes, magnetic inspection prods, or frayed electrical cable.

arc welding — a group of welding processes wherein coalescence is produced by heating with an arc or arcs, with or without the application of pressure, and with or without the use of filler metal

as-brazed — adj. pertaining to the condition of brazements after brazing, prior to any subsequent thermal, mechanical, or chemical treatments

as-welded — adj. pertaining to the condition of weld metal, welded joints, and weldments after welding but prior to any subsequent thermal, mechanical, or chemical treatments

backgouging — the removal of weld metal and base metal from the weld root side of a welded joint to facilitate complete fusion and complete joint penetration upon subsequent welding from that side

backhand welding — a welding technique in which the welding torch or gun is directed opposite to the progress of welding

backing — a material placed at the root of a weld joint for the purpose of supporting molten weld metal so as to facilitate complete joint penetration. The material may or may not fuse into the joint. See *retainer*.

backing gas — a gas, such as argon, helium, nitrogen, or reactive gas, which is employed to exclude oxygen from the root side (opposite from the welding side) of weld joints

base metal — the metal or alloy that is welded, brazed, or cut

bond line (brazing and thermal spraying) — the cross section of the interface between a braze or thermal spray deposit and the substrate

braze — a joint produced by heating an assembly to suitable temperatures and by using a filler metal having a liquidus above 840°F and below the solidus of the base materials. The filler metal is distributed between the closely fitted surfaces of the joint by capillary action.

brazier — one who performs a manual or semiautomatic brazing operation

brazing — a group of metal joining processes which produces coalescence of materials by heating them to a suitable temperature, and by using a filler metal having a liquidus above 840°F and below the solidus of the base materials. The filler metal is distributed between the closely fitted surfaces of the joint by capillary action.

brazing, automatic — brazing with equipment which performs the brazing operation without constant observation and adjustment by a brazing operator. The equipment may or may not perform the loading and unloading of the work.

brazing, block (BB) — a brazing process that uses heat from heated blocks applied to the joint. This is an obsolete or seldom used process.

brazing, dip (DB) — a brazing process in which the heat required is furnished by a molten chemical or metal bath. When a molten chemical bath is used, the bath may act as a flux; when a molten metal bath is used, the bath provides the filler metal.

brazing, furnace (FB) — a brazing process in which the workpieces are placed in a furnace and heated to the brazing temperature

brazing, induction (IB) — a brazing process that uses heat from the resistance of the workpieces to induced electric current

brazing, machine — brazing with equipment which performs the brazing operation under the constant observation and control of a brazing operator. The equipment may or may not perform the loading and unloading of the work.

brazing, manual — a brazing operation performed and controlled completely by hand. See *automatic brazing* and *machine brazing*.

brazing, resistance (RB) — a brazing process that uses heat from the resistance to electric current flow in a circuit of which the workpieces are a part

brazing, semiautomatic — brazing with equipment which controls only the brazing filler metal feed. The advance of the brazing is manually controlled.

01 *brazing, torch (TB)* — a brazing process that uses heat from a fuel gas flame

brazing operator — one who operates machine or automatic brazing equipment

brazing temperature — the temperature to which the base metal(s) is heated to enable the filler metal to wet the base metal(s) and form a brazed joint

brazing temperature range — the temperature range within which brazing can be conducted

build-up of base metal/restoration of base metal thickness — this is the application of a weld material to a base metal so as to restore the design thickness and/or structural integrity. This build-up may be with a chemistry different from the base metal chemistry which has been qualified via a standard butt welded test coupon. Also, may be called base metal repair or buildup.

butt joint — a joint between two members aligned approximately in the same plane

buttering — the addition of material, by welding, on one or both faces of a joint, prior to the preparation of the joint for final welding, for the purpose of providing a suitable transition weld deposit for the subsequent completion of the joint

clad brazing sheet — a metal sheet on which one or both sides are clad with brazing filler metal

coalescence — the growing together or growth into one body of the materials being joined

complete fusion — fusion which has occurred over the entire base material surfaces intended for welding, and between all layers and beads

composite — a material consisting of two or more discrete materials with each material retaining its physical identity

consumable insert — filler metal that is placed at the joint root before welding, and is intended to be completely fused into the root to become part of the weld

contact tube — a device which transfers current to a continuous electrode

corner joint — a joint between two members located approximately at right angles to each other in the form of an L

coupon — see *test coupon*

crack — a fracture-type discontinuity characterized by a sharp tip and high ratio of length and width to opening displacement

defect — a discontinuity or discontinuities that by nature or accumulated effect (for example, total crack length) render a part or product unable to meet minimum applicable acceptance standards or specifications. This term designates rejectability. See also *discontinuity* and *flaw*.

direct current electrode negative (DCEN) — the arrangement of direct current arc welding leads in which the electrode is the negative pole and the workpiece is the positive pole of the welding arc

direct current electrode positive (DCEP) — the arrangement of direct current arc welding leads in which the electrode is the positive pole and the workpiece is the negative pole of the welding arc

discontinuity — an interruption of the typical structure of a material, such as a lack of homogeneity in its mechanical, metallurgical, or physical characteristics. A discontinuity is not necessarily a defect. See also *defect* and *flaw*.

double-welded joint — a joint that is welded from both sides

double-welded lap joint — a lap joint in which the overlapped edges of the members to be joined are welded along the edges of both members

dwell — the time during which the energy source pauses at any point in each oscillation

electrode, arc welding — a component of the welding circuit through which current is conducted

electrode, bare — a filler metal electrode that has been produced as a wire, strip, or bar with no coating or covering other than that incidental to its manufacture or preservation

electrode, carbon — a nonfiller material electrode used in arc welding and cutting, consisting of a carbon or graphite rod, which may be coated with copper or other materials

electrode, composite — a generic term of multicomponent filler metal electrodes in various physical forms, such as stranded wires, tubes, and covered electrodes

electrode, covered — a composite filler metal electrode consisting of a core of a bare electrode or metal-cored electrode to which a covering sufficient to provide a slag layer on the weld metal has been applied. The covering may contain materials providing such functions as shielding from the atmosphere, deoxidation, and arc stabilization, and can serve as a source of metallic additions to the weld.

electrode, electroslag welding — a filler metal component of the welding circuit through which current is conducted between the electrode guiding member and the molten slag

NOTE: Bare electrodes and composite electrodes as defined under arc welding electrode are used for electroslag welding. A consumable guide may also be used as part of the electroslag welding electrode system.

electrode, emissive — a filler metal electrode consisting of a core of a bare electrode or a composite electrode to which a very light coating has been applied to produce a stable arc

electrode, flux-cored — a composite filler metal electrode consisting of a metal tube or other hollow configuration containing ingredients to provide such functions as shielding atmosphere, deoxidation, arc stabilization, and slag formation. Alloying materials may be included in the core. External shielding may or may not be used.

electrode, lightly coated — a filler metal electrode consisting of a metal wire with a light coating applied subsequent to the drawing operation, primarily for stabilizing the arc

electrode, metal — a filler or nonfiller metal electrode used in arc welding and cutting that consists of a metal wire or rod that has been manufactured by any method and that is either bare or covered

electrode, metal-cored — a composite filler metal electrode consisting of a metal tube or other hollow configuration containing alloying ingredients. Minor amounts of ingredients providing such functions as arc stabilization and fluxing of oxides may be included. External shielding gas may or may not be used.

electrode, resistance welding — the part of a resistance welding machine through which the welding current and, in most cases, force are applied directly to the workpiece. The electrode may be in the form of a rotating wheel, rotating roll, bar, cylinder, plate, clamp, chuck, or modification thereof.

electrode, stranded — a composite filler metal electrode consisting of stranded wires which may mechanically enclose materials to improve properties, stabilize the arc, or provide shielding

electrode, tungsten — a nonfiller metal electrode used in arc welding, arc cutting, and plasma spraying, made principally of tungsten

face feed — the application of filler metal to the face side of a joint

ferrite number — an arbitrary, standardized value designating the ferrite content of an austenitic stainless steel weld metal. It should be used in place of percent ferrite or volume percent ferrite on a direct one-to-one replacement basis. See the latest edition of AWS A4.2, Standard Procedures for Calibrating Magnetic Instruments to Measure the Delta Ferrite Content of Austenitic Stainless Steel Weld Metal.

filler metal — the metal or alloy to be added in making a welded, brazed, or soldered joint

filler metal, brazing — the metal or alloy used as a filler metal in brazing, which has a liquidus above 450°C (840°F) and below the solidus of the base metal

filler metal, powder — filler metal in particle form

filler metal, supplemental — in electroslag welding or in a welding process in which there is an arc between one or more consumable electrodes and the workpiece, a powder, solid, or composite material that is introduced into the weld other than the consumable electrode(s)

fillet weld — a weld of approximately triangular cross section joining two surfaces approximately at right angles to each other in a lap joint, tee joint, or corner joint

flaw — an undesirable discontinuity. See also *defect*.

flux (welding/brazing) — a material used to dissolve, prevent, or facilitate the removal of oxides or other undesirable surface substances. It may act to stabilize the arc, shield the molten pool, and may or may not evolve shielding gas by decomposition.

flux, active (SAW) — a flux from which the amount of elements deposited in the weld metal is dependent upon the welding conditions, primarily arc voltage

flux, alloy (SAW) — a flux which provides alloying elements in the weld metal deposit

flux, neutral (SAW) — a flux which will not cause a significant change in the weld metal composition when there is a large change in the arc voltage

flux cover — metal bath dip brazing and dip soldering. A layer of molten flux over the molten filler metal bath.

forehand welding — a welding technique in which the welding torch or gun is directed toward the progress of welding

frequency — the completed number of cycles which the oscillating head makes in 1 min or other specified time increment

fuel gas — a gas such as acetylene, natural gas, hydrogen, propane, stabilized methylacetylene propadiene, and other fuels normally used with oxygen in one of the oxyfuel processes and for heating

fused spray deposit (thermal spraying) — a self-fluxing thermal spray deposit which is subsequently heated to coalescence within itself and with the substrate

fusion (fusion welding) — the melting together of filler metal and base metal, or of base metal only, to produce a weld

fusion face — a surface of the base metal that will be melted during welding

fusion line — a non-standard term for weld interface

gas backing — see backing gas

globular transfer (arc welding) — a type of metal transfer in which molten filler metal is transferred across the arc in large droplets

groove weld — a weld made in a groove formed within a single member or in the groove between two members to be joined. The standard types of groove weld are as follows:

square groove weld

single-Vee groove weld

single-bevel groove weld

single-U groove weld

single-J groove weld

single-flare-bevel groove weld

single-flare-Vee groove weld

double-Vee groove weld

double-bevel groove weld

double-U groove weld

double-J groove weld

double-flare-bevel groove weld

double-flare-Vee groove weld

heat-affected zone — that portion of the base metal which has not been melted, but whose mechanical properties or microstructures have been altered by the heat of welding or cutting

interpass temperature — the highest temperature in the weld joint immediately prior to welding, or in the case of multiple pass welds, the highest temperature in the section of the previously deposited weld metal, immediately before the next pass is started

joint — the junction of members or the edges of members which are to be joined or have been joined

joint penetration — the distance the weld metal extends from the weld face into a joint, exclusive of weld reinforcement

keyhole welding — a technique in which a concentrated heat source penetrates partially or completely through a workpiece, forming a hole (keyhole) at the leading edge of the weld pool. As the heat source progresses, the molten metal fills in behind the hole to form the weld bead.

lap or overlap — the distance measured between the edges of two plates when overlapping to form the joint

lap joint — a joint between two overlapping members in parallel planes

lower transformation temperature — the temperature at which austenite begins to form during heating

melt-in — a technique of welding in which the intensity of a concentrated heat source is so adjusted that a weld pass can be produced from filler metal added to the leading edge of the molten weld metal

oscillation — for a machine or automatic process, an alternating motion relative to the direction of travel of welding, brazing, or thermal spray device. See also *weave bead*.

overlay — a non-standard term, used in Section IX, for surfacing. See *hard-facing* and *corrosion-resistant overlay*.

overlay, corrosion-resistant weld metal — deposition of one or more layers of weld metal to the surface of a base material in an effort to improve the corrosion resistance properties of the surface. This would be

applied at a level above the minimum design thickness as a nonstructural component of the overall wall thickness.

overlay, hard-facing weld metal — deposition of one or more layers of weld metal to the surface of a material in an effort to improve the wear resistance properties of the surface. This would be applied at a level above the minimum design thickness as a nonstructural component of the overall wall thickness.

pass — a single progression of a welding or surfacing operation along a joint, weld deposit, or substrate. The result of a pass is a weld bead or layer.

pass, cover — a final or cap pass(es) on the face of a weld

pass, wash — pass to correct minor surface aberrations and/or prepare the surface for nondestructive testing

peel test — a destructive method of testing that mechanically separates a lap joint by peeling

peening — the mechanical working of metals using impact blows

performance qualification — the demonstration of a welder's or welding operator's ability to produce welds meeting prescribed standards

plug weld — a weld made in a circular, or other geometrically shaped hole (like a slot weld) in one member of a lap or tee joint, joining that member to the other. The walls of the hole may or may not be parallel, and the hole may be partially or completely filled with weld metal. (A fillet-welded hole or spot weld should not be construed as conforming to this definition.)

polarity, reverse — the arrangement of direct current arc welding leads with the work as the negative pole and the electrode as the positive pole of the welding arc; a synonym for direct current electrode positive

polarity, straight — the arrangement of direct current arc welding leads in which the work is the positive pole and the electrode is the negative pole of the welding arc; a synonym for direct current electrode negative

postbrazing heat treatment — any heat treatment subsequent to brazing

postheating — the application of heat to an assembly after welding, brazing, soldering, thermal spraying, or thermal cutting

postweld heat treatment — any heat treatment subsequent to welding

powder — see *filler metal, powder*

preheat maintenance — practice of maintaining the minimum specified preheat temperature, or some specified higher temperature for some required time interval after welding or thermal spraying is finished or until post weld heat treatment is initiated

preheat temperature — the minimum temperature in the weld joint preparation immediately prior to the welding; or in the case of multiple pass welds, the minimum temperature in the section of the previously deposited weld metal, immediately prior to welding

preheating — the application of heat to the base metal immediately before a welding or cutting operation to achieve a specified minimum preheat temperature

pulsed power welding — any arc welding method in which the power is cyclically programmed to pulse so that effective but short duration values of a parameter can be utilized. Such short duration values are significantly different from the average value of the parameter. Equivalent terms are pulsed voltage or pulsed current welding. See also *pulsed spray welding*.

pulsed spray welding — an arc welding process variation in which the current is pulsed to utilize the advantages of the spray mode of metal transfer at average currents equal to or less than the globular to spray transition current

rabbet joint — typical design is indicated in QB-462.1(c), QB-462.4, QB-463.1(c), and QB-463.2(a)

retainer — nonconsumable material, metallic or nonmetallic, which is used to contain or shape molten weld metal. See *backing*.

seal weld — any weld designed primarily to provide a specific degree of tightness against leakage

seam weld — a continuous weld made between or upon overlapping members in which coalescence may start and occur on the faying surfaces, or may have proceeded from the surface of one member. The continuous weld may consist of a single weld bead or a series of overlapping spot welds. See *resistance welding*.

short-circuiting transfer (gas metal-arc welding) — metal transfer in which molten metal from a consumable electrode is deposited during repeated short circuits. See also *globular transfer* and *spray transfer*.

single-welded joint — a joint welded from one side only

single-welded lap joint — a lap joint in which the overlapped edges of the members to be joined are welded along the edge of one member only

slag inclusion — nonmetallic solid material entrapped in weld metal or between weld metal and base metal

specimen — refer to test specimen

spot weld — a weld made between or upon overlapping members in which coalescence may start and occur on the faying surfaces or may proceed from the outer surface of one member. The weld cross section (plan view) is approximately circular.

spray-fuse — a thermal spraying technique in which the deposit is reheated to fuse the particles and form a metallurgical bond with the substrate

spray transfer (arc welding) — metal transfer in which molten metal from a consumable electrode is propelled axially across the arc in small droplets

stringer bead — a weld bead formed without appreciable weaving

surfacing — the application by welding, brazing, or thermal spraying of a layer(s) of material to a surface to obtain desired properties or dimensions, as opposed to making a joint

tee joint (T) — a joint between two members located approximately at right angles to each other in the form of a T

test coupon — a weld or braze assembly for procedure or performance qualification testing. The coupon may be any product from plate, pipe, tube, etc., and may be a fillet weld, overlay, deposited weld metal, etc.

test specimen — a sample of a test coupon for specific test. The specimen may be a bend test, tension test, impact test, chemical analysis, macrotest, etc. A specimen may be a complete test coupon, for example, in radiographic testing or small diameter pipe tension testing.

thermal cutting (TC) — a group of cutting processes that severs or removes metal by localized melting, burning, or vaporizing of the workpieces

throat, actual (of fillet) — the shortest distance from the root of a fillet weld to its face

throat, effective (of fillet) — the minimum distance from the fillet face, minus any convexity, to the weld root. In the case of fillet welds combined with a groove weld, the weld root of the groove weld shall be used.

throat, theoretical (of fillet) — the distance from the beginning of the joint root perpendicular to the hypotenuse of the largest right triangle that can be inscribed within the cross-section of a fillet weld. This dimension is based on the assumption that the root opening is equal to zero.

undercut — a groove melted into the base metal adjacent to the weld toe or weld root and left unfilled by weld metal

upper transformation temperature — the temperature at which transformation of the ferrite to austenite is completed during heating

usability — a measure of the relative ease of application of a filler metal to make a sound weld or braze joint

weave bead — for a manual or semiautomatic process, a weld bead formed using weaving. See also *oscillation*.

weaving — a welding technique in which the energy source is oscillated transversely as it progresses along the weld path

weld — a localized coalescence of metals or nonmetals produced either by heating the materials to the welding temperature, with or without the application of pressure, or by the application of pressure alone and with or without the use of filler material

weld, autogenous — a fusion weld made without filler metal

weld bead — a weld deposit resulting from a pass. See *stringer bead* and *weave bead*.

weld face — the exposed surface of a weld on the side from which welding was done

weld interface — the interface between the weld metal and base metal in a fusion weld

weld metal — metal in a fusion weld consisting of that portion of the base metal and filler metal melted during welding

weld reinforcement — weld metal on the face or root of a groove weld in excess of the metal necessary for the specified weld size

weld size: groove welds — the depth of chamfering plus any penetration beyond the chamfering, resulting in the strength carrying dimension of the weld

weld size: for equal leg fillet welds — the leg lengths of the largest isosceles right triangle which can be inscribed within the fillet weld cross section

weld size: for unequal leg fillet welds — the leg lengths of the largest right triangle which can be inscribed within the fillet weld cross section

welder — one who performs manual or semiautomatic welding

welding, arc stud (SW) — an arc welding process that uses an arc between a metal stud, or similar part, and the other workpiece. The process is used without filler metal, with or without shielding gas or flux, with or

without partial shielding from a ceramic or graphite ferrule surrounding the stud, and with the application of pressure after the faying surfaces are sufficiently heated.

welding, automatic — welding with equipment which performs the welding operation without adjustment of the controls by a welding operator. The equipment may or may not perform the loading and unloading of the work. See *machine welding*.

welding, consumable guide electroslag — an electroslag welding process variation in which filler metal is supplied by an electrode and its guiding member

welding, electrogas (EGW) — an arc welding process that uses an arc between a continuous filler metal electrode and the weld pool, employing approximately vertical welding progression with retainers to confine the weld metal. The process is used with or without an externally supplied shielding gas and without the application of pressure. Shielding for use with solid or metal-cored electrodes is obtained from a gas or gas mixture. Shielding for use with flux-cored electrodes may or may not be obtained from an externally supplied gas or gas mixture.

welding, electron beam (EBW) — a welding process that produces coalescence with a concentrated beam composed primarily of high velocity electrons, impinging on the joint. The process is used without shielding gas and without the application of pressure.

welding, electroslag (ESW) — a welding process producing coalescence of metals with molten slag which melts the filler metal and the surfaces of the work to be welded. The molten weld pool is shielded by this slag which moves along the full cross section of the joint as welding progresses. The process is initiated by an arc which heats the slag. The arc is then extinguished and the conductive slag is maintained in a molten condition by its resistance to electric current passing between the electrode and the work. See *electroslag welding electrode* and *consumable guide electroslag welding*.

welding, flux-cored arc (FCAW) — a gas metal-arc welding process that uses an arc between a continuous filler metal electrode and the weld pool. The process is used with shielding gas from a flux contained within the tubular electrode, with or without additional shielding from an externally supplied gas, and without the application of pressure.

welding, friction (FRW) — a solid state welding process that produces a weld under compressive force contact of workpieces rotating or moving relative to one another

to produce heat and plastically displace material from the faying surfaces

welding, friction, inertia and continuous drive — processes and types of friction welding (solid state welding process) wherein coalescence is produced after heating is obtained from mechanically induced sliding motion between rubbing surfaces held together under pressure. Inertia welding utilizes all of the kinetic energy stored in a revolving flywheel spindle system. Continuous drive friction welding utilizes the energy provided by a continuous drive source such as an electric or hydraulic motor.

welding, gas metal-arc (GMAW) — an arc welding process that uses an arc between a continuous filler metal electrode and the weld pool. The process is used with shielding from an externally supplied gas and without the application of pressure.

welding, gas metal-arc, pulsed arc (GMAW-P) — a variation of the gas metal-arc welding process in which the current is pulsed. See also *pulsed power welding*.

welding, gas metal-arc, short-circuiting arc (GMAW-S) — a variation of the gas metal-arc welding process in which the consumable electrode is deposited during repeated short circuits. See also *short-circuiting transfer*.

welding, gas tungsten-arc (GTAW) — an arc welding process which produces coalescence of metals by heating them with an arc between a tungsten (nonconsumable) electrode and the work. Shielding is obtained from a gas or gas mixture. Pressure may or may not be used and filler metal may or may not be used. (This process has sometimes been called TIG welding, a nonpreferred term.)

welding, gas tungsten-arc, pulsed arc (GTAW-P) — a variation of the gas tungsten-arc welding process in which the current is pulsed. See also *pulsed power welding*.

welding, induction (IW) — a welding process that produces coalescence of metals by the heat obtained from resistance of the workpieces to the flow of induced high frequency welding current with or without the application of pressure. The effect of the high-frequency welding current is to concentrate the welding heat at the desired location.

welding, laser beam (LBW) — a welding process which produces coalescence of materials with the heat obtained from the application of a concentrated coherent light beam impinging upon the members to be joined

welding, machine — welding with equipment which performs the welding operation under the constant observation and control of a welding operator. The

equipment may or may not perform the loading and unloading of the work. See *automatic welding*.

welding, manual — welding wherein the entire welding operation is performed and controlled by hand

welding, operator — one who operates machine or automatic welding equipment

welding, oxyfuel gas (OFW) — a group of welding processes which produces coalescence by heating materials with an oxyfuel gas flame or flames, with or without the application of pressure, and with or without the use of filler metal

welding, plasma-arc (PAW) — an arc welding process which produces coalescence of metals by heating them with a constricted arc between an electrode and the workpiece (transferred arc), or the electrode and the constricting nozzle (nontransferred arc). Shielding is obtained from the hot, ionized gas issuing from the torch orifice which may be supplemented by an auxiliary source of shielding gas. Shielding gas may be an inert gas or a mixture of gases. Pressure may or may not be used, and filler metal may or may not be supplied.

welding, projection (PW) — a resistance welding process that produces coalescence by the heat obtained from the resistance of the flow of welding current. The resulting welds are localized at predetermined points by projections, embossments, or intersections. The metals to be joined lap over each other.

welding, resistance (RW) — a group of welding processes that produces coalescence of the faying surfaces with the heat obtained from resistance of the workpieces to the flow of the welding current in a circuit of which the workpieces are a part, and by the application of pressure

welding, resistance seam (RSEW) — a resistance welding process that produces a weld at the faying surfaces of overlapped parts progressively along a length of a joint. The weld may be made with overlapping weld nuggets, a continuous weld nugget, or by forging the

joint as it is heated to the welding temperature by resistance to the flow of the welding current.

welding, resistance spot (RSW) — a resistance welding process that produces a weld at the faying surfaces of a joint by the heat obtained from resistance to the flow of welding current through the workpieces from electrodes that serve to concentrate the welding current and pressure at the weld area

welding, resistance stud — a resistance welding process wherein coalescence is produced by the heat obtained from resistance to electric current at the interface between the stud and the workpiece, until the surfaces to be joined are properly heated, when they are brought together under pressure

welding, semiautomatic arc — arc welding with equipment which controls only the filler metal feed. The advance of the welding is manually controlled.

welding, shielded metal-arc (SMAW) — an arc welding process with an arc between a covered electrode and the weld pool. The process is used with shielding from the decomposition of the electrode covering, without the application of pressure, and with filler metal from the electrode

welding, stud — a general term for the joining of a metal stud or similar part to a workpiece. Welding may be accomplished by arc, resistance, friction, or other suitable process with or without external gas shielding.

welding, submerged-arc (SAW) — an arc welding process that uses an arc or arcs between a bare metal electrode or electrodes and the weld pool. The arc and molten metal are shielded by a blanket of granular flux on the workpieces. The process is used without pressure and with filler metal from the electrode and sometimes from a supplemental source (welding rod, flux, or metal granules).

weldment — an assembly whose constituent parts are joined by welding, or parts which contain weld metal overlay
